Introduction

For over a decade, the City of Charlotte has pioneered a policy of monitoring neighborhood level quality of life and taking proactive actions to protect and improve these basic building blocks of the city. Starting with the publication of the City Within A City (CWAC) Neighborhood Assessment in 1993, city leaders and policy makers have had a document that enabled them to take a detailed look at the issues that need to be addressed in order to maintain and improve neighborhood vitality.

In 1997, the Neighborhood Assessment was followed by the CWAC Neighborhood Quality of Life Index. This study evaluated the quality of life in 73 inner city neighborhoods through an analysis of a wide ranging set of variables. In turn, these variables were aggregated into social, physical, crime, and economic dimensions that were combined to create a quality of life index or score for each neighborhood. Individual neighborhoods were labeled “stable,” “threatened,” or “fragile,” based upon the cumulative variable scores. The data presented in the report offered a baseline of information that enabled the city to carry out an ongoing review of neighborhood level quality of life. The index study was intended to serve as a benchmark, a first step in an ongoing program to monitor progress toward the goals of sustaining and renewing the neighborhoods of CWAC.

In 2000, the Charlotte Neighborhood Quality of Life Study expanded the geographical scope of the earlier inner city analysis. It evaluated the quality of life in 173 neighborhood statistical areas (NSAs) covering the entire city and the city’s Sphere of Influence. The 2000 study constructed an index measurement using 19 locally based variables that measured neighborhood social, physical, and economic conditions. The most important improvement of this study was that it offered a citywide baseline for measuring cumulative and individual changes in NSAs in the future.

The Charlotte Neighborhood Quality of Life studies in 2002 and 2004 closely followed the framework and format of the 2000 report. The composition of study variables changed slightly in order to strengthen the rigor of the statistical analysis.

This report, Charlotte Neighborhood Quality of Life 2006, replicates and builds upon the research framework established in the two previous iterations of this process. However, it also incorporates selective improvements. These changes were made following discussion with Charlotte and Mecklenburg County professional staff who are primary users of the study, as well as, neighborhood and community leaders who rely on the study to help gauge the growth and changes in their neighborhoods and communities.

The most apparent shift from earlier neighborhood quality of life studies is a new nomenclature for labeling NSAs. The terms “stable,” “threatened,” and “fragile” which were used in every report since 1993 are changed to “stable,” “transitioning,” and “challenged”. The research methodology used to classify NSAs has not changed. The shift in labels was made in order to better describe what the research findings are reporting. In particular, the middle category represents a transitional position between the highest ranking quality of life NSAs and the lowest ranked NSAs. The former term “threatened” connoted a substandard performance, when, in fact, an NSA was in a middle or transitional position.

The replacement of the term “fragile” with “challenged” is similarly based upon a better descriptive label. The meaning of “fragile” in the context of quality of life definitions is somewhat imprecise. It also implies a static condition. In contrast, the descriptor “challenged” conveys a community that is experiencing lower than average quality of life, but is not permanently fixed in a substandard position. Indeed, NSAs have moved from this lowest position to a “stable” category. This type of improvement is difficult to achieve, however, it is a goal that all neighborhood and community leaders are striving to achieve.

A second change from the earlier quality of life reports is a more detailed analysis of NSAs change over time. Previous reports provided a process for comparing individual NSAs to other NSAs, as well as, to citywide averages for individual analytical variables. This report continues to offer detailed intra-neighborhood analysis, but expands the level and detail of the information. So that, it examines changes in neighborhood rankings and features an expanded section showing the direction of NSA changes during the past four years.

As in the past, this report includes a neighborhood profile page for each NSA. It is presented in Appendix A. The profile includes quality of life rankings, background statistics, and the individual descriptive data for each of the 20 variables used in the quality of life analysis along with their comparable citywide data.

Defining Quality of Life

Quality of Life can mean many things to different people. One of the most critical challenges is how to correctly and efficiently measure the concept. Many academics and planners maintain that in order for a community to enjoy a high level of quality of life, residents should feel safe from crime, live in affordable and safe housing, and should have access to good quality education and employment. Indeed, these are basic expectations for a livable community. They transcend economic status, age, race or ethnicity, household composition, or any other demographic marker.

Beyond the basic factors, there are many more subjective ideas, often framed by local or regional constructs, about what makes a neighborhood a good place to live. These ideas often revolve around the structure of a neighborhood or the lifestyle of the residents. Urban, suburban, or rural settings may translate into different scales or different ideas about what constitutes quality of life.

Despite challenges, many cities and regions throughout North America and Europe are developing locally-based measures to assess quality of life. Studies such as the *Providence Neighborhood Fact Book*, *Jacksonville Quality-of-Life Report*, *Sustainable Indicators in Seattle*, *Sustainable Pittsburgh*, and the *Boston Indicators Project* are commonly cited prototypes. The Washington DC-based Urban Institute has been working with a select group of U.S. cities on a “National

Neighborhood Indicators Project” which compiles and documents the use of additional neighborhood-level evaluation systems around the U.S. Taken together, over 200 American communities have examined or implemented quality of life studies. Some have collected measures of quality of life incorporating local, environmental, social, and economic conditions. But most communities have relied on published data from the U.S. Census Bureau to measure quality of life.

The notion of quality of life as a multi-faceted concept includes a wide variety of critical factors that operate within a unified framework. In this case, the Charlotte neighborhood quality of life research model defines neighborhood quality of life as a nexus where social well being, physical characteristics, crime, and economic vitality are all considered. In all, 20 variables make up this quality of life composite (Table 1). A detailed description of each of these factors is contained in Appendix B, *Neighborhood Profiles: User Guide*. The selection of the individual variables was made following extensive discussion and consultations with the sponsoring organizations and staff from the cooperating city and county partners.

Percent Change in House Value

Methods

The findings reported in this study were derived from a statistical analysis of 20 variables collected for 173 Neighborhood Statistical Areas (NSAs). Within this framework, the 20 variables were organized into four groups representing the major dimensions that make up local quality of life. These four dimensions are social, physical, crime, and economic.

The data were standardized prior to calculating quality of life scores. The standardization was done by computing the mean value for the NSAs on each of the 20 variables. The mean measure for each variable was assigned a value of zero and each NSA score was expressed in terms of the number of standard deviations above or below the mean (Z scores). This procedure converts all variables to the same unit and allows NSA scores to be combined in order to derive an overall or composite score based on multiple variables. In selected cases, the variables used in the analysis were inverse measures of the quality of life, so that, a high value may indicate a low quality of life condition. The signs of the Z scores for these variables were reversed before summing scores for several variables to derive an overall or cumulative score for the quality of life.

Subsequently, individual quality of life scores were calculated for each NSA and for each of the four groups of variables. The composite score was then determined for each neighborhood using the four dimensions (social, physical, crime, and economic) by summing the Z scores of the individual variables. Once the composite Z scores were determined on a dimension for the NSAs, these scores were standardized again, i.e. each neighborhood's score was expressed in terms of the number of standard deviation units above or below the mean. Consequently, a high positive score indicated a high quality of life condition in the NSA.

Finally, an overall or composite quality of life index for each NSA was calculated by summing the four dimensions. In computing the overall index, the four dimensions were weighted in the following manner: social, 30%; physical, 30%; crime, 30%; and economic, 10%. These scores were standardized by setting the mean value to zero and expressing each neighborhood's score in standard deviation units above or below the mean. Therefore, large positive scores indicate a high quality of life, while large negative scores reveal a low quality of life.

In addition to the citywide analysis using the 173 NSAs, the same procedure was employed to determine quality of life scores for the CWAC neighborhoods as a separate group. This analysis is presented in Appendix D, CWAC Analysis.

A companion document, **Charlotte Neighborhood Quality of Life Technical Report 2006**, contains the complete set of data for all individual variables, as well as, maps displaying the distribution of variables across NSAs.

Geographic Units

The quality of life analysis is applied to 173 NSAs encompassing all of Charlotte and its Sphere of Influence (Figure 1). The only exclusions are seven non-residential areas that have no expected residential future, and, therefore, are not included in the NSA framework. The NSA boundaries are delineated by the Charlotte-Mecklenburg Planning Commission. These neighborhood scale geographies have been used by the Planning Commission and other city and county staff for a variety of community-based initiatives.

The CWAC geography is structured around 73 inner city neighborhoods. These boundaries roughly follow 1990 U.S. Census block group and block boundaries (Figure 2). Table 2 lists the CWAC neighborhood name and NSA number. In developing the CWAC neighborhood boundaries, the Planning Commission staff devised alignments that best matched communities of interest. Existing neighborhood organizations and community groups offered guidance and advice on where their boundaries should be drawn. While the advice of every community group border was not always followed, efforts to select the best set of boundaries were made.

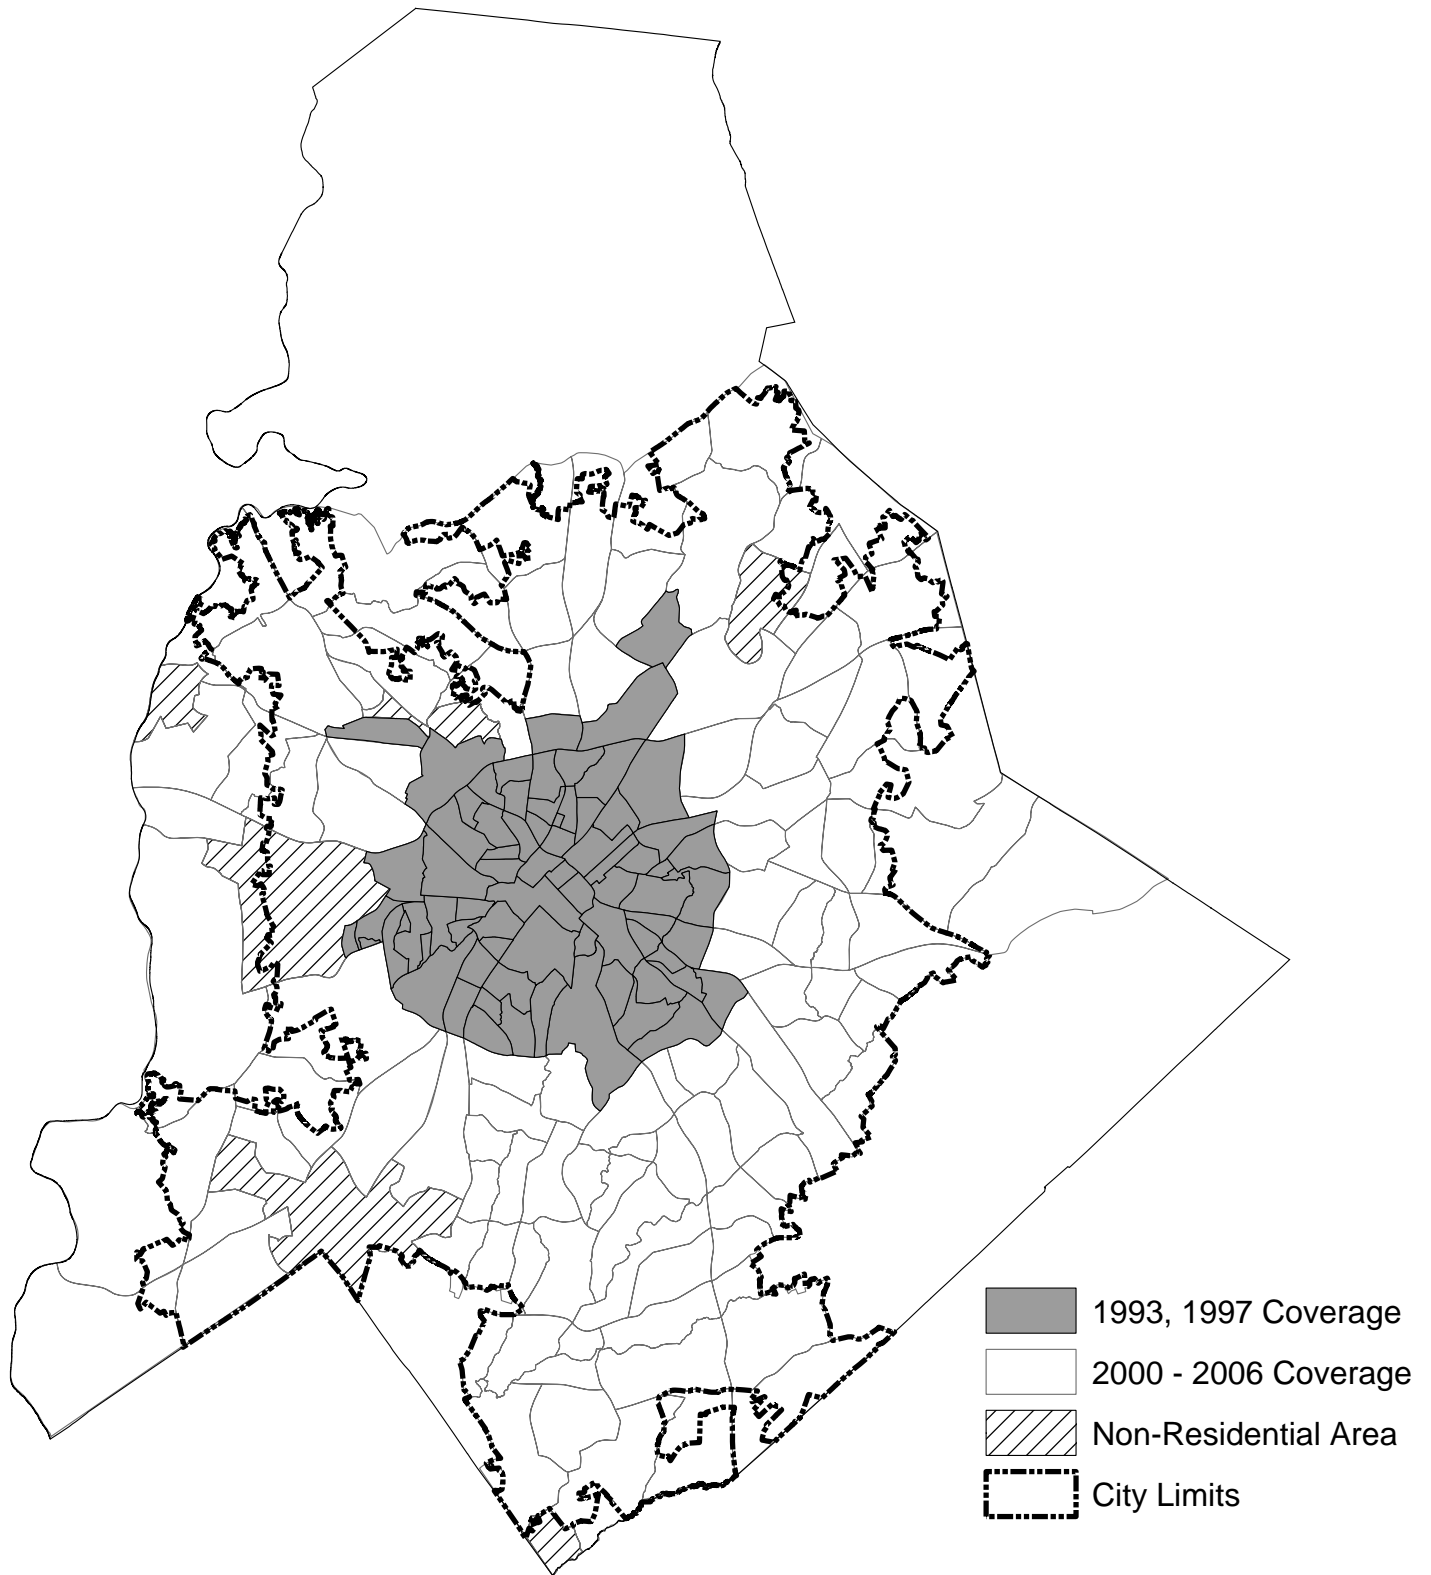

Outside the CWAC area, Planning Commission staff delineated neighborhood centered units for the more suburban residential areas in Charlotte and its Sphere of Influence in 2000 (Figure 3). Again, 1990 U.S. Census block group and block boundaries were utilized as guides. In most cases, individual NSAs were comprised of multiple residential subdivisions.

In 2006, two minor NSA boundaries were altered to incorporate new residential growth that had been left out of the 2000 delineation. Where changes occurred, there is no significant impact of the analyses used in this report. Future changes in NSA boundaries will be minimal and take place only when neighborhood conditions warrant action. This “fixed boundary” rule is used in order to allow comparisons of neighborhoods over time.

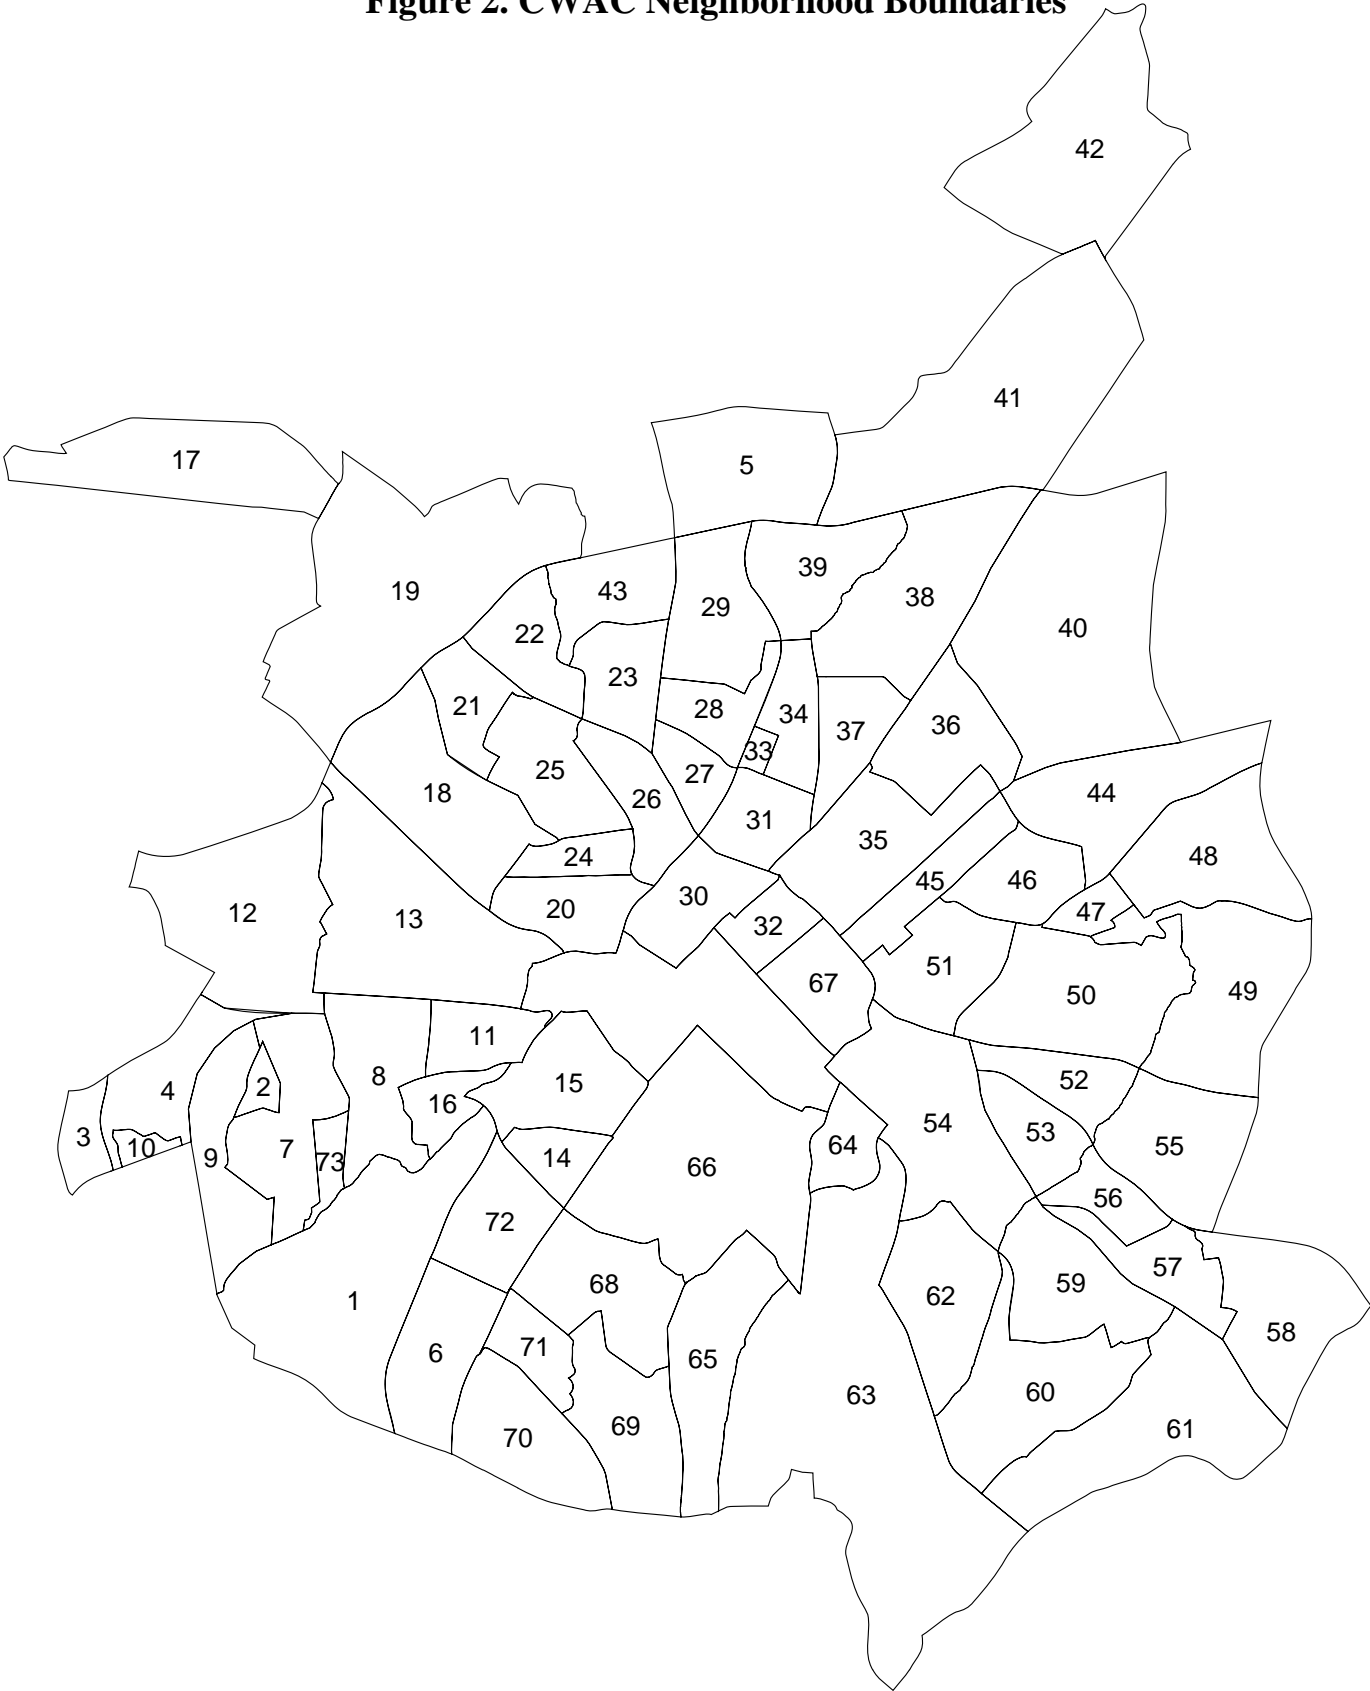

A list of neighborhood names and NSA numbers are provided in Table 3. Since individuals and communities have different perceptions of neighborhood boundaries and name identification, some neighborhoods may have multiple ways of being identified.

Stable, Transitioning, and Challenged Neighborhoods

The Charlotte Neighborhood Quality of Life research model is built around a comprehensive assessment of community level quality of life. Within this framework, the individual variables are organized into four dimensions: social, physical, crime and economic. In turn, these dimensions are aggregated into a cumulative quality of life index. Based upon this numeric value, NSAs are classified into three groups: “stable,” “transitioning,” and “challenged”.

Arranging the NSAs into categories is a useful approach for creating a general template that can convey the idea of quality of life at a small, localized scale. Moreover, it permits a comparison of the quality of life between NSAs, as well as, within the entire city. However, this general three part categorization formula should only be used to assess a generic level of need in a community. Each NSA is unique. Accordingly, each NSAs score on an individual dimension and individual variables should be regarded as more useful to assessing the specific conditions and needs of that NSA.

In broad terms, the categories “stable,” “transitioning,” and “challenged” reflect community conditions relative to other NSAs. As a measure for separating local inter-NSA quality of life, the terms translate into the following broad standards.

Stable: NSAs that exhibit few neighborhood scale problems. These are neighborhoods that score high on the social, physical, crime, and economic dimensions.

Transitioning: These are NSAs that are around average on most dimensions, but also display a weakness on one or more of the dimensions. This pattern may be signaling a shift in the overall NSA quality of life.

Transitional status can indicate an improving or declining position, relative to other Charlotte NSAs.

Challenged: Challenged NSAs generally have low to moderate scores on some or all quality of life dimensions. A challenged neighborhood has a lower quality of life than other communities in Charlotte and is “at risk” on multiple dimensions.

This study looks at the very broad issues in each community, as well as, detailed data. When assessing individual NSA needs, it is essential to examine the data at both the general level, as well as, the particular circumstances that cause a rating. The specific variable values that are used to compile the rankings are contained in the **Charlotte Neighborhood Quality of Life Technical Report 2006**.

Citywide Quality of Life Results

The quality of life experienced by residents in a particular area can vary from person to person. Because of the individuality of the concept, quantifying the meaning and rating local conditions is a complicated task. Nonetheless, in order to assess what makes a community a desirable, safe, and socially healthy place to live, it is necessary to reduce the complex idea of quality of life to a manageable set of measurable information. This information can, in turn, be used to assess community characteristics and improve neighborhoods across the city.

For this study, it was determined that a strong, healthy NSA has few social needs, low crime rates, low levels of physical deterioration, and low levels of economic stress. These are important aspects of any healthy community. However, these qualities do not occur independently. For example, neighborhoods with high crime rates typically have relatively high rates of social need or physical deterioration. This type of situation illustrates the need to address quality of life from many different perspectives, utilizing the talents and resources of many people and organizations in a cooperative effort with neighborhood residents.

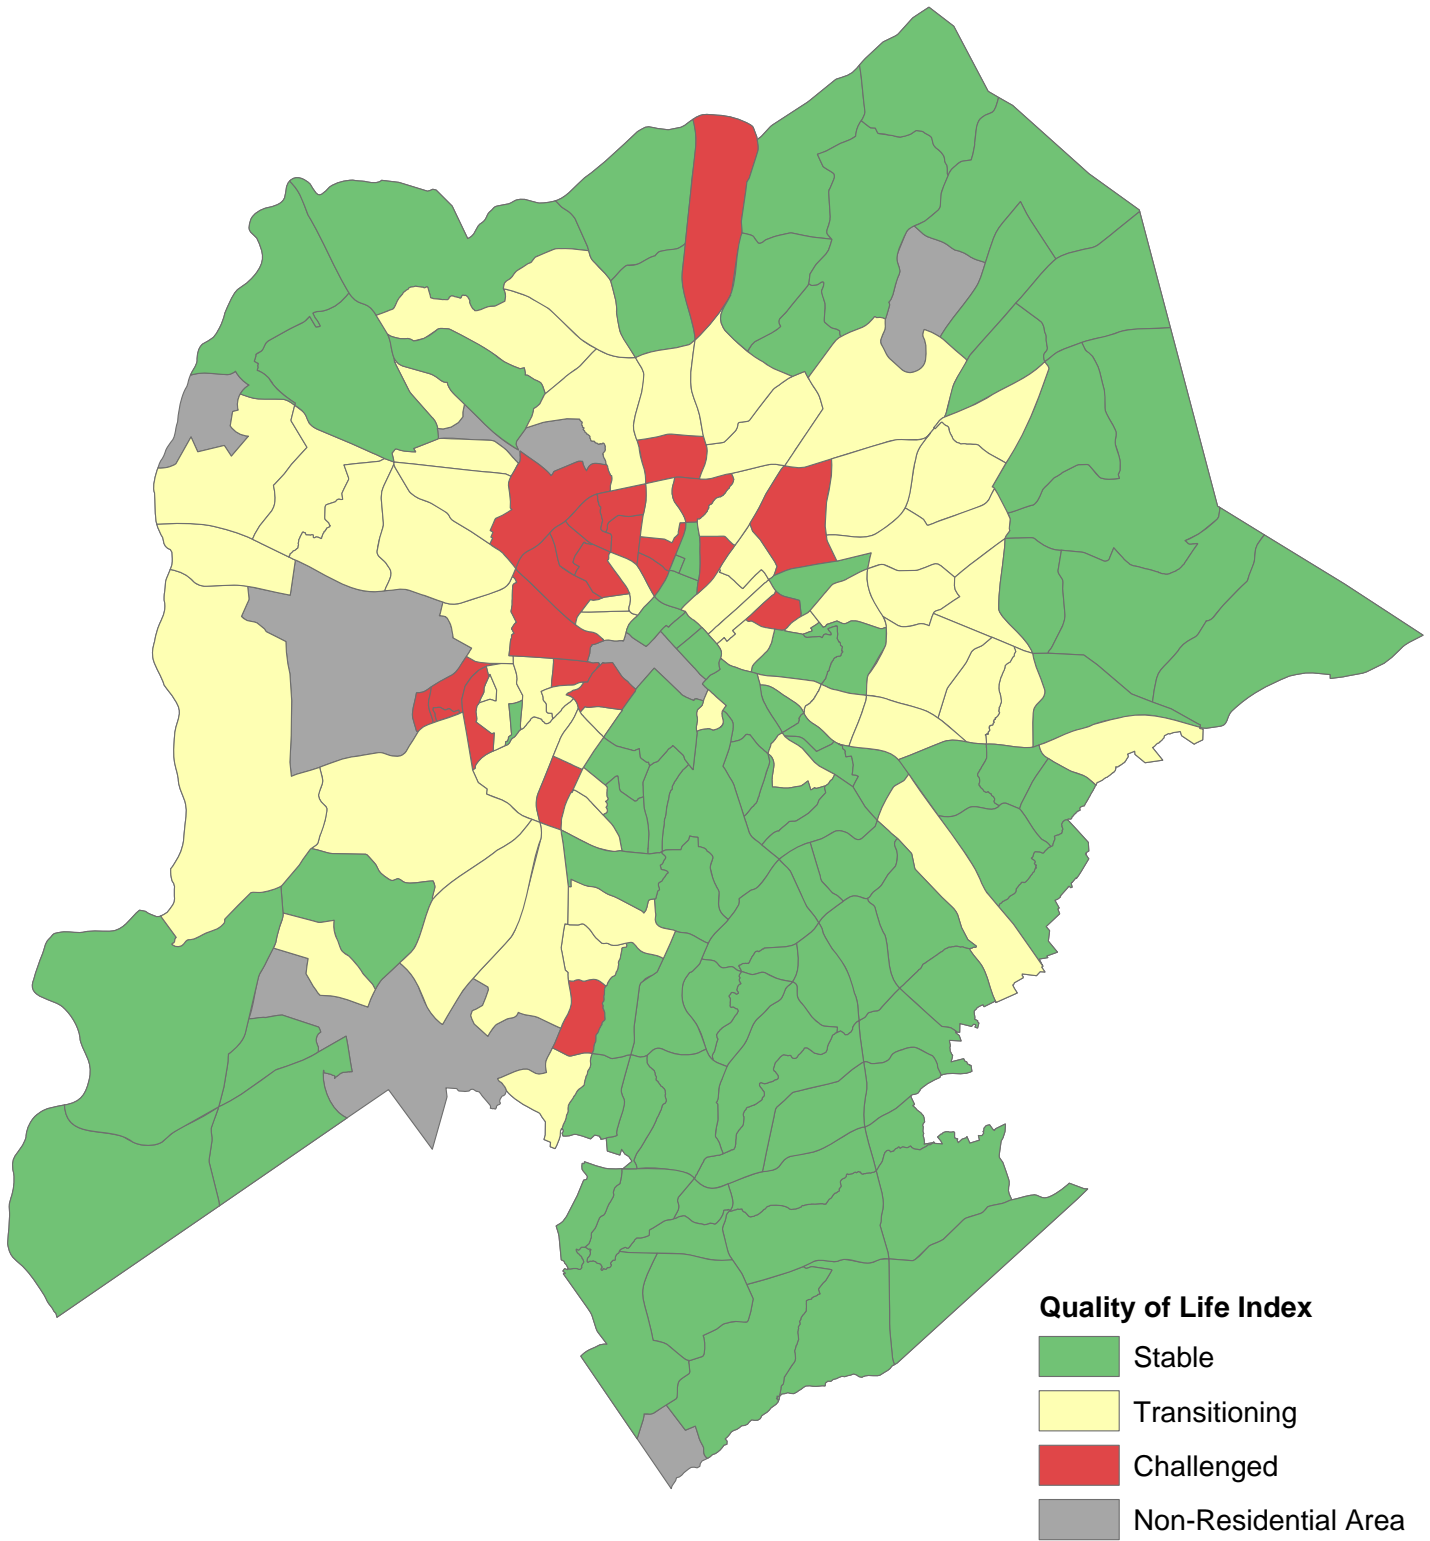

Fundamentally, the distribution of strong residential communities across a jurisdiction is a key building block for a successful city. Acknowledging the interrelated issues of quality of life is the first step in creating a program to routinely assess progress toward healthy neighborhoods and focus efforts on strengthening the residential structure.

Among Charlotte's 173 NSAs, 89 were classified as "stable," 60 were classified as "transitioning," and 24 were classified as "challenged". These findings are displayed in Figure 4. Companion maps, presented as Figures 5 and 6, contain the results with the identifying NSA label numbers. The CWAC geography is shown in Figure 5, while the remainder of the city is covered in Figure 6. A table presenting the research results follows as Table 4.

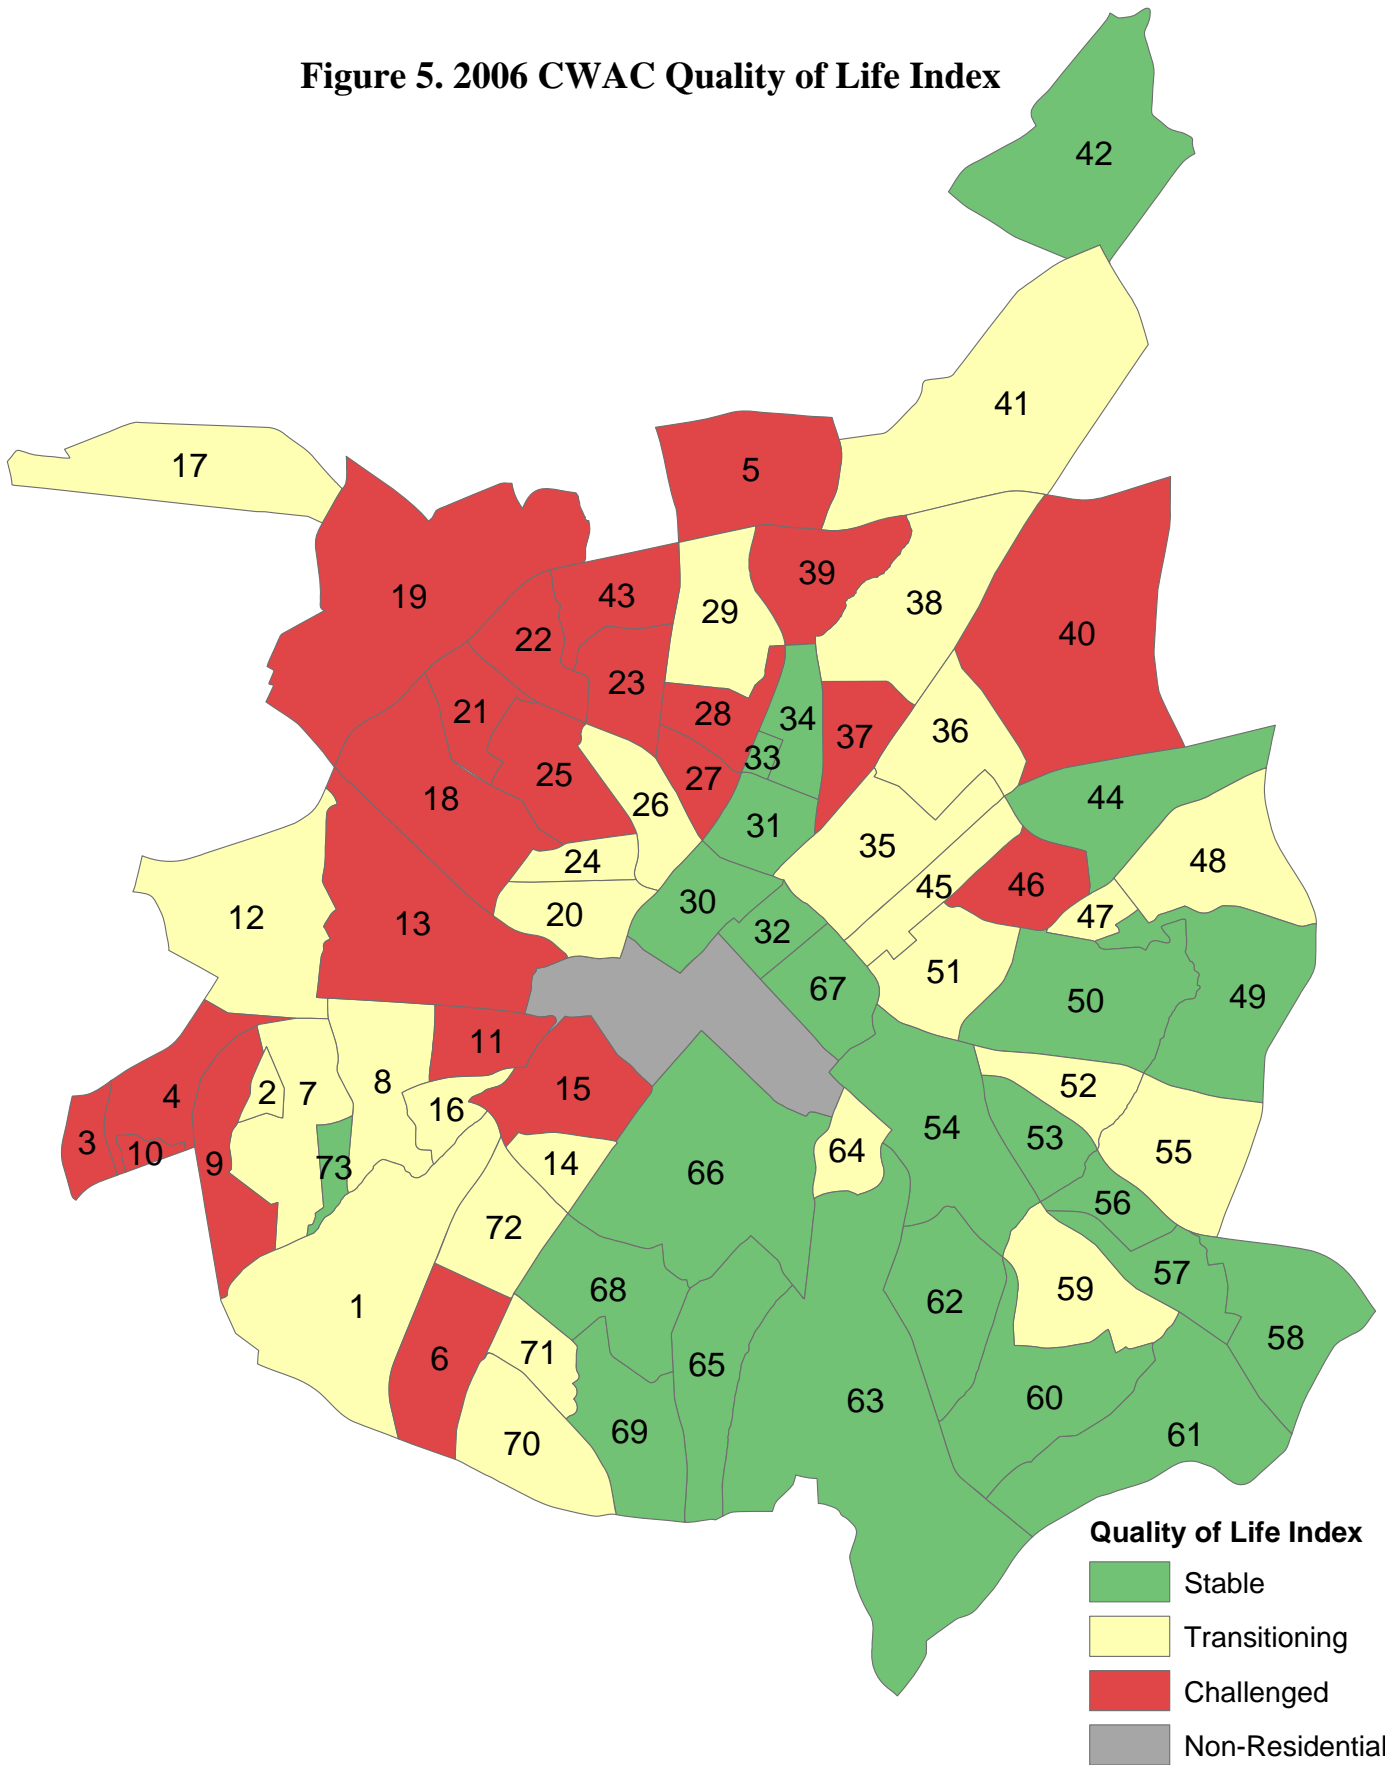

A review of the 2006 Quality of Life results finds that earlier geographical patterns continue to persist. The greatest concentrations of Stable NSAs were concentrated in the southeast and southwest, northwest, and east suburban districts of Charlotte and the Sphere of Influence. Transitioning neighborhoods were generally clustered in the west and the older suburban portions of east Charlotte. Challenged neighborhoods were concentrated in the west, northeast, and north sections of inner city Charlotte.

Four Dimensions of Quality of Life

Measuring the quality of life in a large and diverse community, such as Charlotte, is a complex task. The city's neighborhoods are diverse and continually changing. Because individual NSAs have such varied needs, it is necessary to assess their strengths and weaknesses from multiple perspectives. Recognizing that each place is unique, this study looks at each NSA from 20 different perspectives (variables) measuring community level quality of life across a wide array of factors. These perspectives are then aggregated into four broad, but core dimensions of quality of life. These are social, physical, crime, and economic dimensions.

The following four sections of this report, present the NSA level finding for each of these dimensions. **Charlotte Neighborhood Quality of Life Technical Report 2006**, a companion document for this study, contains the NSA level and citywide data for each of the 20 analysis variables.

Social Dimension

Overview

The social well being of a neighborhood is dependent upon many interconnected issues. Neighborhoods with a desirable quality of life are economically and socially diverse. They have healthy populations with a mix of older and younger residents. They are served by strong public schools and they have residents that are involved in their community. These neighborhoods provide strong role models for youth and opportunities for young people to be involved in a variety of after-school activities. The social vitality of a neighborhood is an important dimension of a comprehensive assessment of neighborhood quality of life.

Results

NSAs exhibiting the attributes listed above have low levels of social need. NSAs with some signs of social stress are classified as presenting a medium level of need. Lastly, NSAs experiencing social distress have the highest level of social needs. Individual NSA classifications, as well as the geographical pattern of the results are presented in Figures 7 and 8.

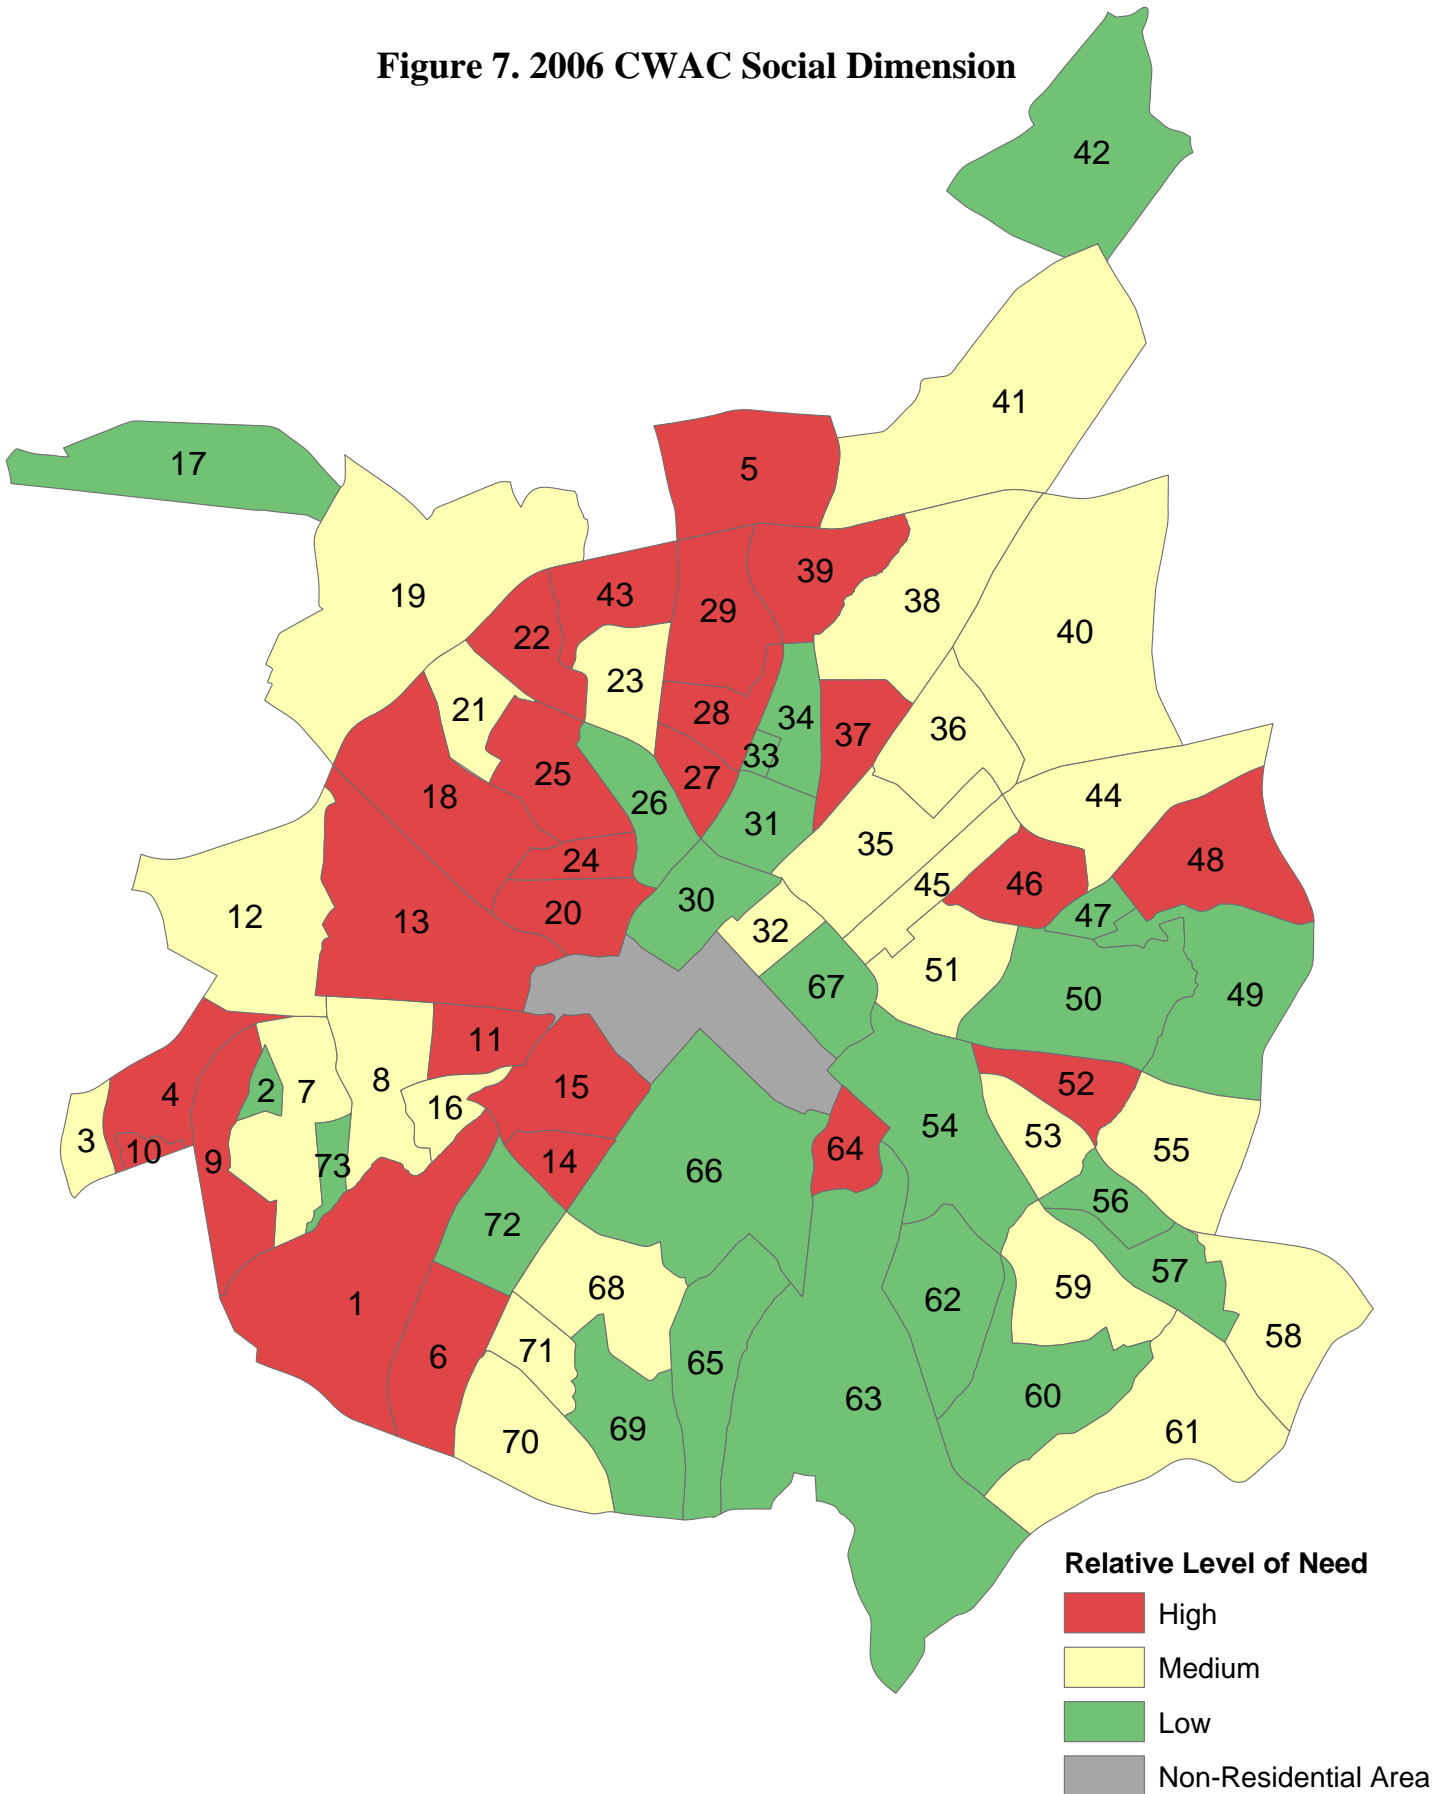

Among all NSAs, 86 have low social needs, 62 have medium levels of social needs and 25 are classified as having high levels of social needs. In general geographic terms, peripheral suburban NSAs display low levels of social needs. In contrast, the greatest concentrations of NSAs with medium to high levels of social needs are geographically clustered in the north and westside CWAC neighborhoods and extend into the western and northeastern areas of Charlotte.

In reviewing and interpreting the social dimension, it is critical to remember that individual NSA classifications reflect unique differences between NSAs, as well as, broader patterns of problems within communities. Consequently, it is important to acknowledge that variables are often related and do not act with complete independence. For example, low scores on competency exams are correlated with high rates of births to adolescents. Thus, related variables exhibiting similar scores signal a need to target specific populations or problem areas in an NSA.

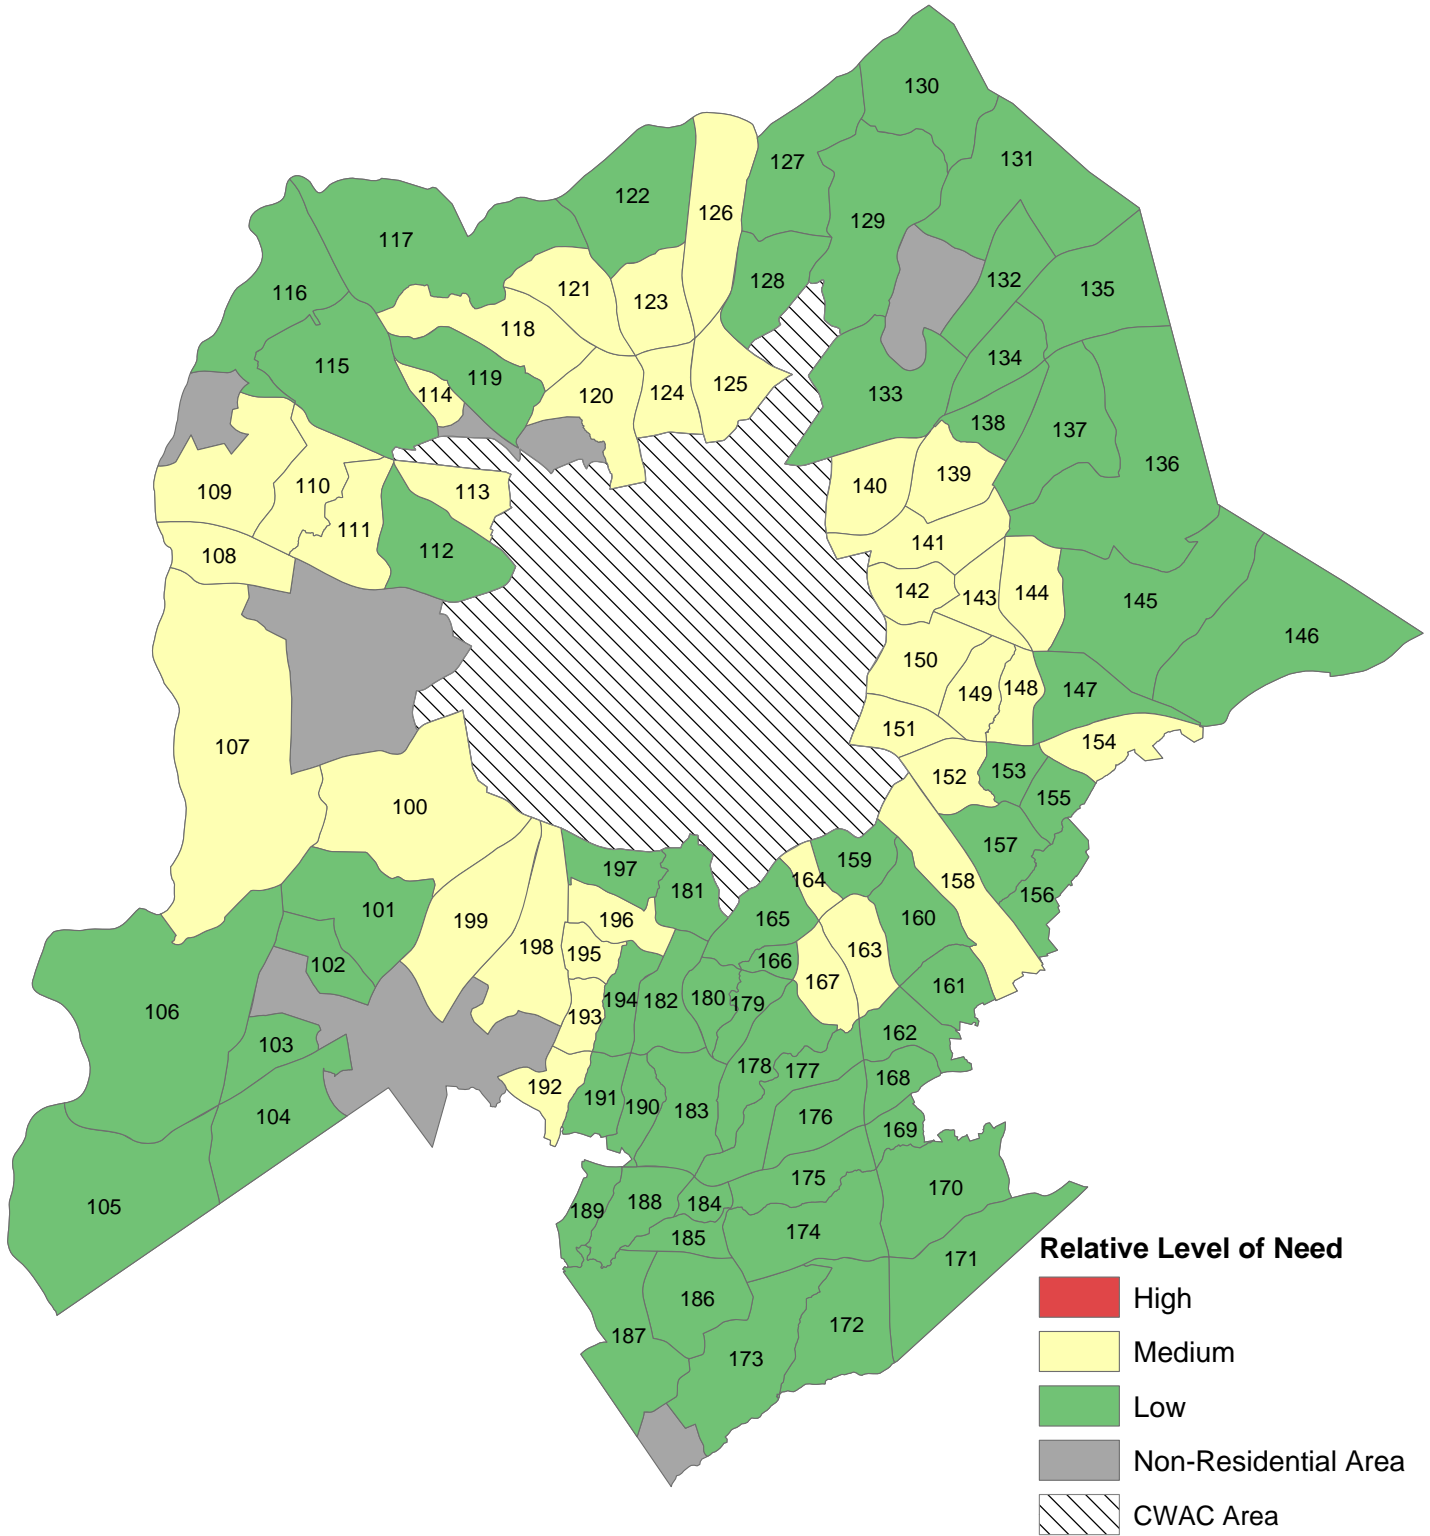

Social need is only one component of neighborhood quality of life. Nevertheless, social distress tends to exacerbate the larger set of issues that affect the quality of life in communities with the greatest needs. In this regard, individual variables included in the quality of life study help to pinpoint specific problems and identify the type of organizations that are best qualified to address those deficiencies. By tracking specific scores over time, progress toward established goals can be assessed and communities strengthened.

Figure 7. 2006 CWAC Social Dimension

Metropolitan Studies Group, August 2006, TML

Figure 8. 2006 Social Dimension

Metropolitan Studies Group, August 2006, TML

Crime Dimension

Overview

Crime rates play an integral role in the overall quality of life in an area. High rates of crime create undesirable and unstable living environments. This report measures various categories of crime in each NSA and compares these rates to a citywide average. By measuring crime rates between small geographic areas and the larger city area, it is easier to assess whether the criminal activity in an NSA is abnormally high, around average, or below the citywide norm.

Results

The crime dimension findings are laid out in Figures 10 and 11. Of the 173 NSAs, 108 have low levels of crime, 43 are classified as having medium levels of crime, and 22 are experiencing high levels of crime. In Charlotte, crime is a geographically focused problem. NSAs with high levels of crime are spatially concentrated in northeastern and western CWAC neighborhoods and in adjoining NSAs. Those NSAs with medium levels of crime exhibit a different pattern. Spatially, they tend to be grouped in the northern portions of CWAC and the adjacent northeastern and southwestern NSAs. There is also a

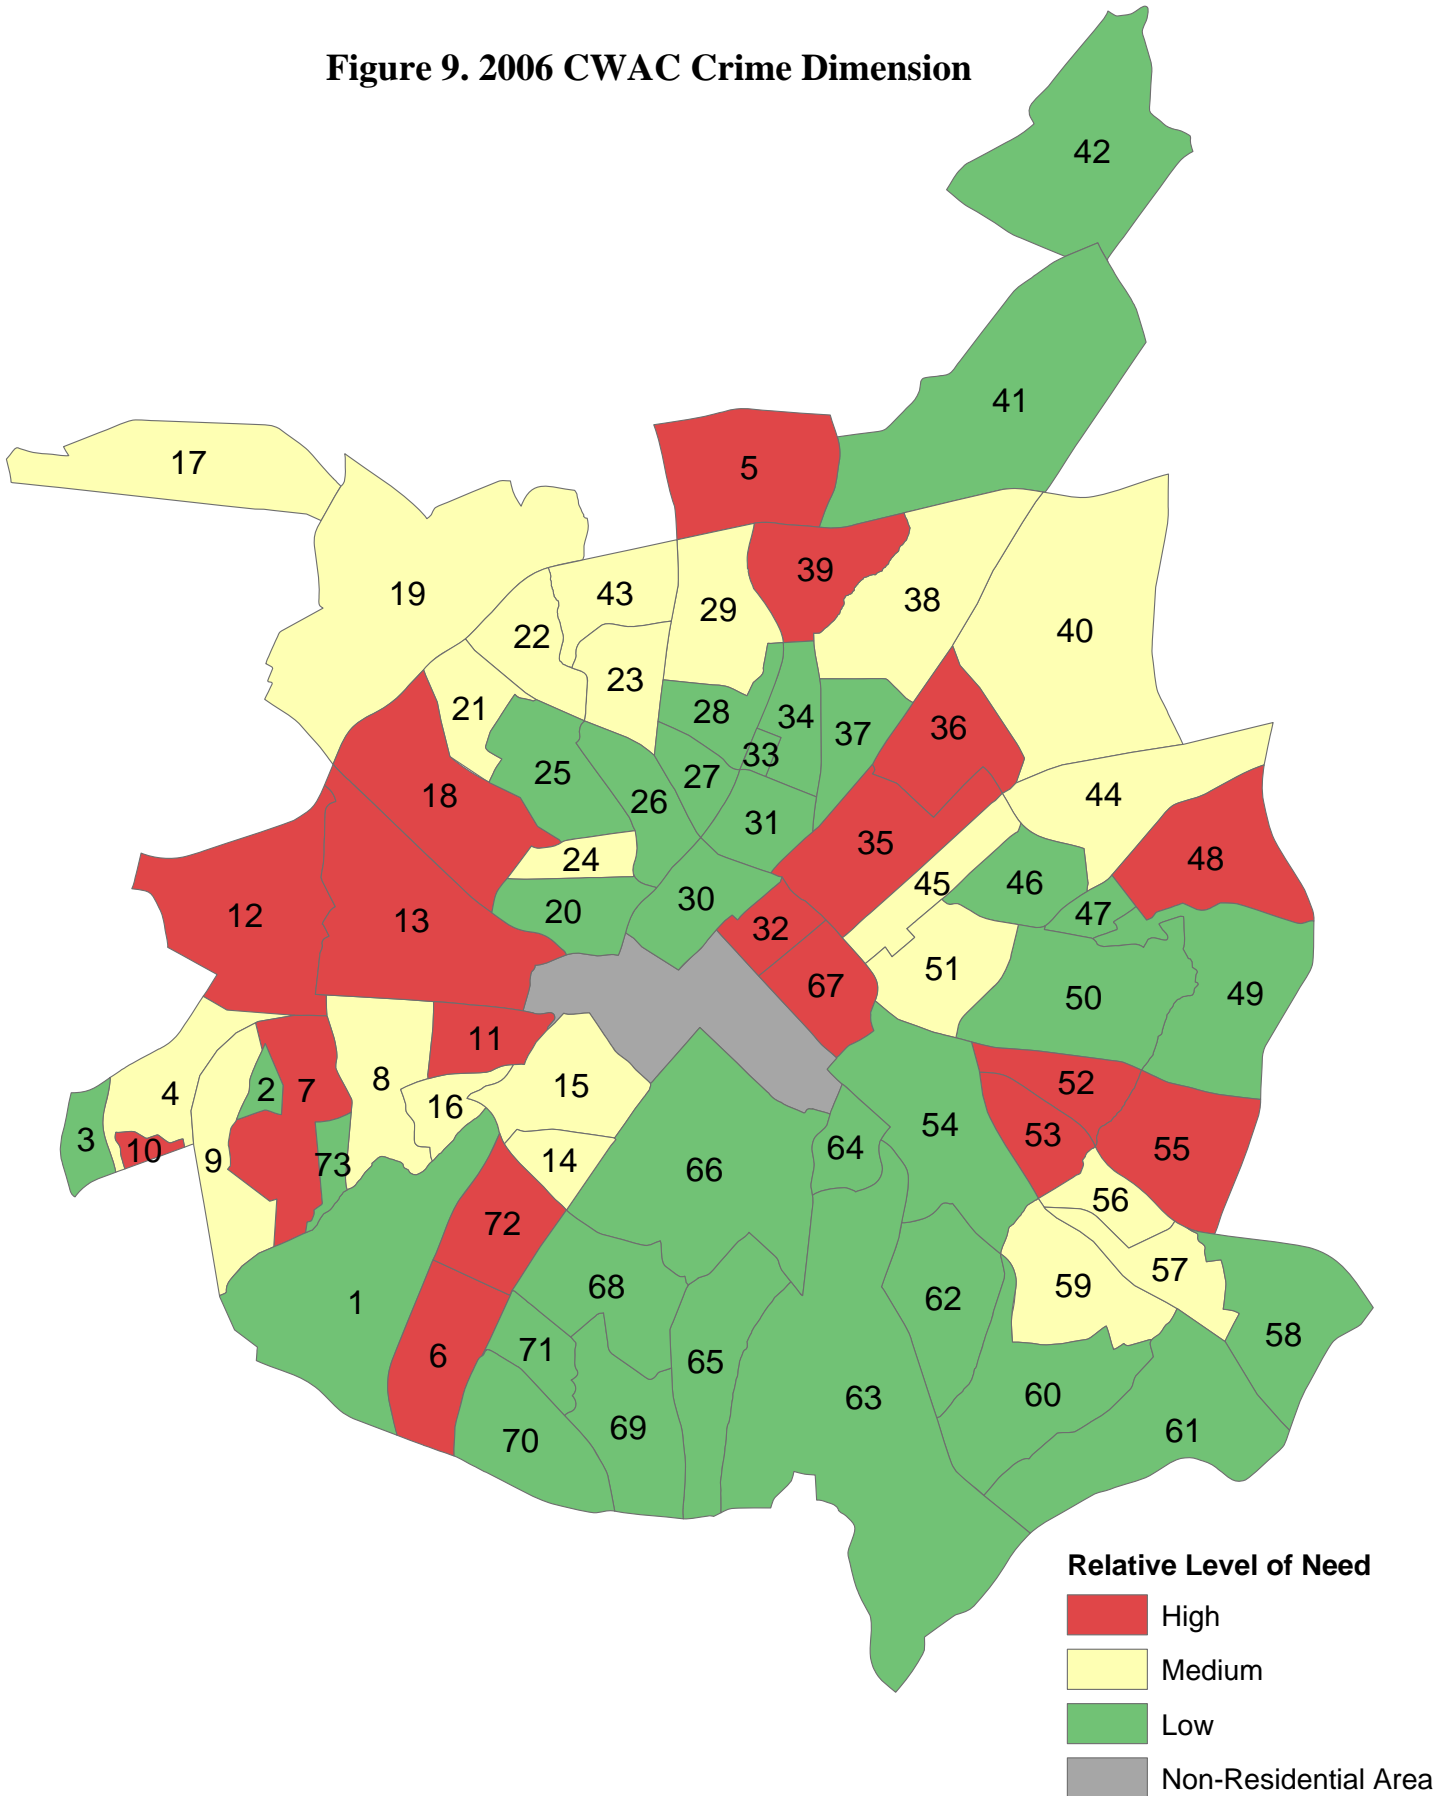

concentration of medium level crime in east Charlotte. One overall geographical finding is that communities impacted by high rates of criminal activity tend to be clustered together, rather than isolated from each other. Aside from these concentrated geographies, most Charlotte NSAs are characterized as having relatively low levels of crime.

In reviewing and interpreting the crime dimension, it is critical to remember that each NSA crime classification reflects unique differences between neighborhoods, as well as, the social and economic context within neighborhoods. Levels of crime are sometimes related to the physical or social conditions in a neighborhood. For example, NSAs with large numbers of businesses have higher concentrations of property crime, while areas that attract large numbers of youth have a greater problem with juvenile linked crime.

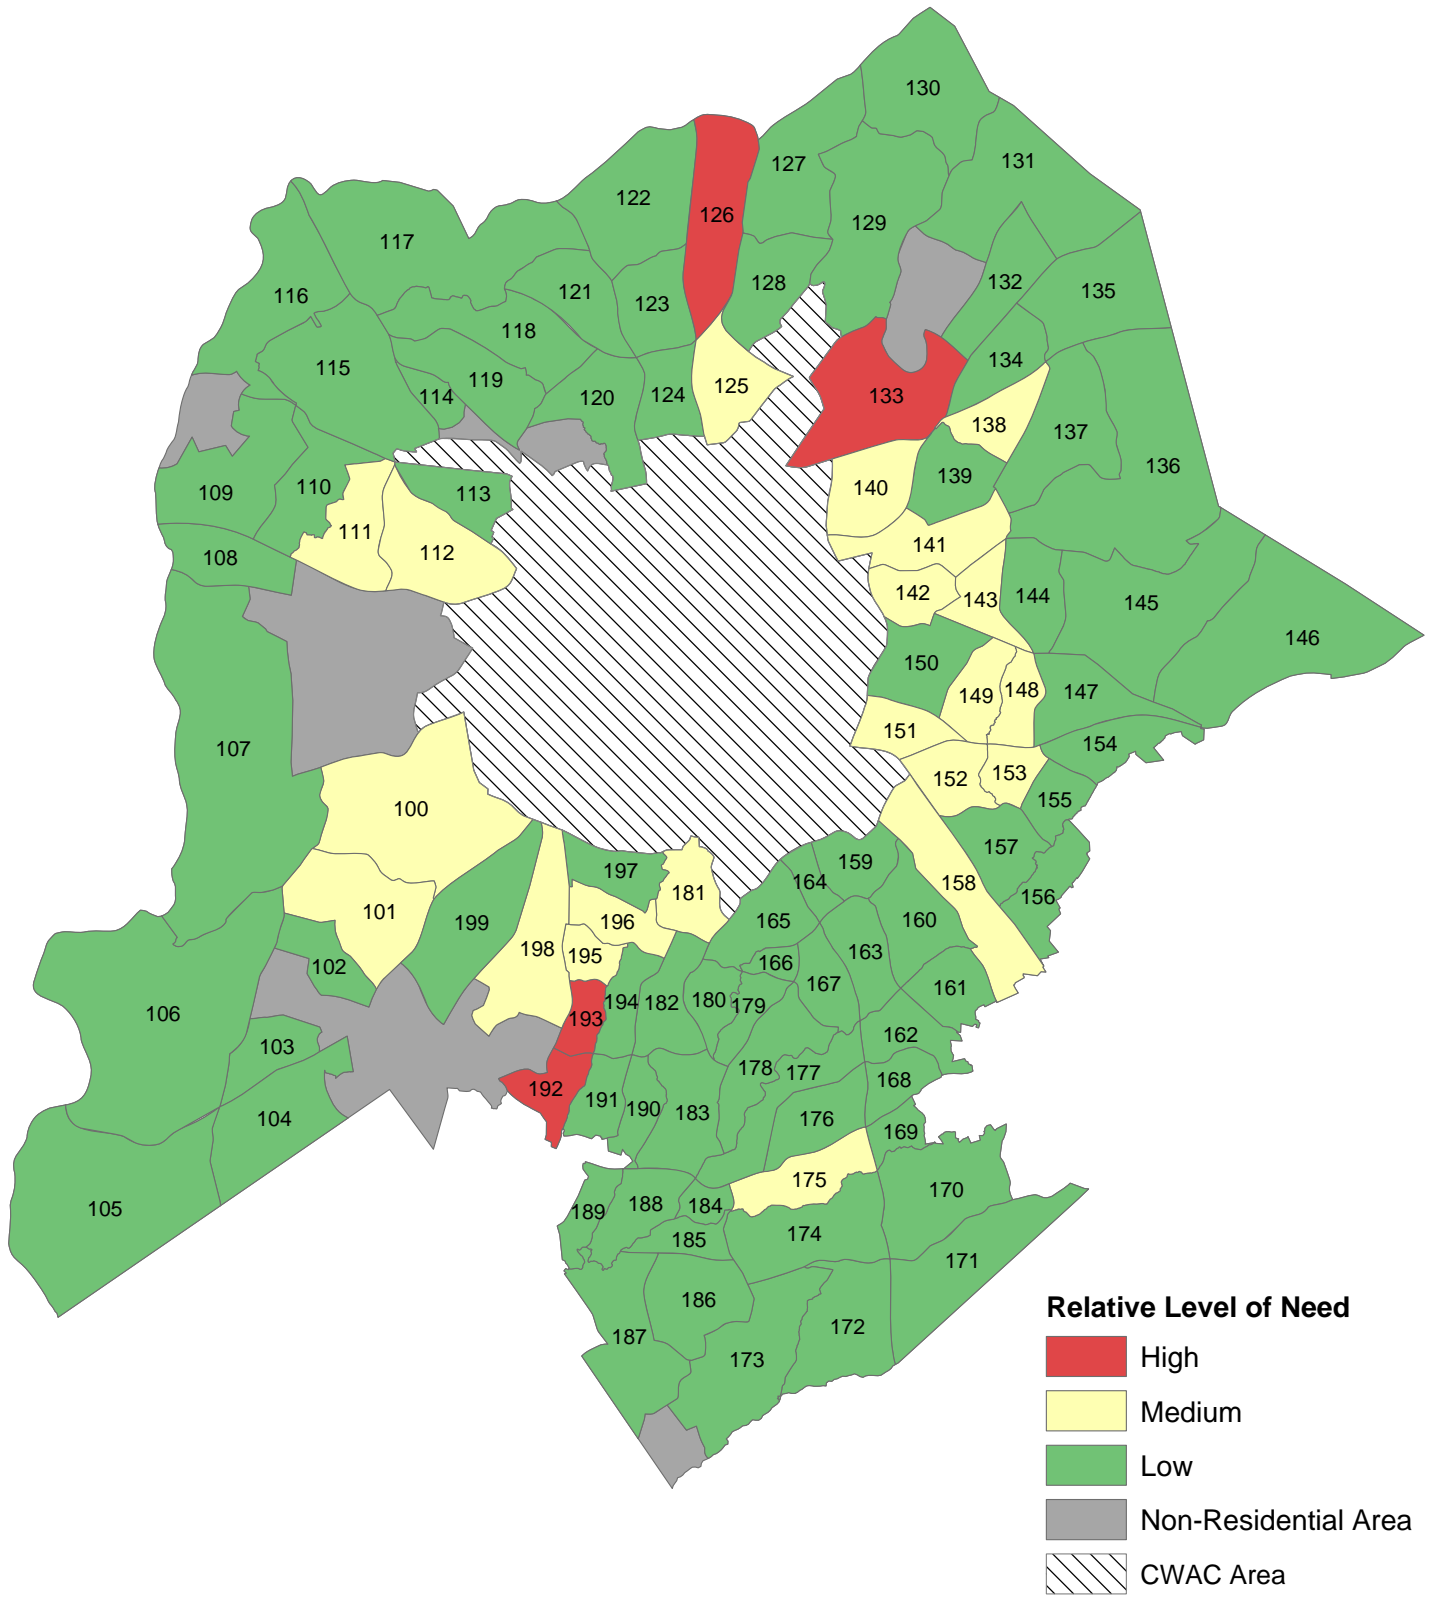

Crime is only one component of neighborhood quality of life. Nevertheless, the crime categorization helps identify NSAs that have the greatest needs in this area. Monitoring and tracking crime levels over time can assess progress toward measurable goals. Moreover, areas that have persistently high levels of crime can be targeted for special efforts.

Figure 9. 2006 CWAC Crime Dimension

Metropolitan Studies Group, August 2006, TML

Figure 10. 2006 Crime Dimension

Metropolitan Studies Group, August 2006, TML

Physical Dimension

Overview

The physical appearance of a community is a visual cue to the level of social and economic distress experienced by residents. Deteriorated housing stock or vacant and abandoned businesses indicate a neighborhood in trouble or at risk. Lack of maintenance of neighborhood structures weakens the social fabric of a neighborhood. In contrast, well-maintained public areas and infrastructure, attractive housing, and accessibility to basic retail establishments indicate a low level of stress—a desirable and safe place to live.

Results

Figures 11 and 12 contain the results of the physical dimension analysis. Overall, 96 NSAs are classified as having relatively low levels of physical need, 57 have medium levels of physical need, and 20 are classified as having relatively high levels of physical need. Neighborhoods with low levels of physical need were found throughout Charlotte.

However, in general, there is a suburban orientation to these communities. NSAs with medium levels of physical need are clustered in northeast and western Charlotte, with a disproportionate number found in the older inner city neighborhoods. Finally, NSAs with the highest levels of physical need are almost exclusively located in three distinct areas of CWAC and adjoining the NSAs in the southwest, west, and north quadrants of the city.

Physical Dimension scores represent a composite assessment of the structure and character of the NSA. The condition of buildings, lots, and businesses sets the tone and helps formulate an image for a community. A well-kept community gives a sense of security to those who live in or visit a neighborhood.

The physical integrity of a neighborhood is important in maintaining the quality of life of residents. All citizens benefit from clean, safe environments. Therefore, assessing the overall level of physical stress in a neighborhood is a necessary prerequisite to organizing strategic methods for improving conditions.

Economic Dimension

Overview

The economic vitality and character of a neighborhood are among the most commonly cited quality of life indicators. Often, household income is used as a primary metric to assess quality of life. When this is done, the evaluation of economic condition can easily become biased toward high wealth neighborhoods. This report looks at a different measure of economic vitality, one which is less biased toward higher income communities. It uses three variables that broadly measure economic status. They are the change in median income, the percentage of persons receiving food stamps, and the average change in residential house values.

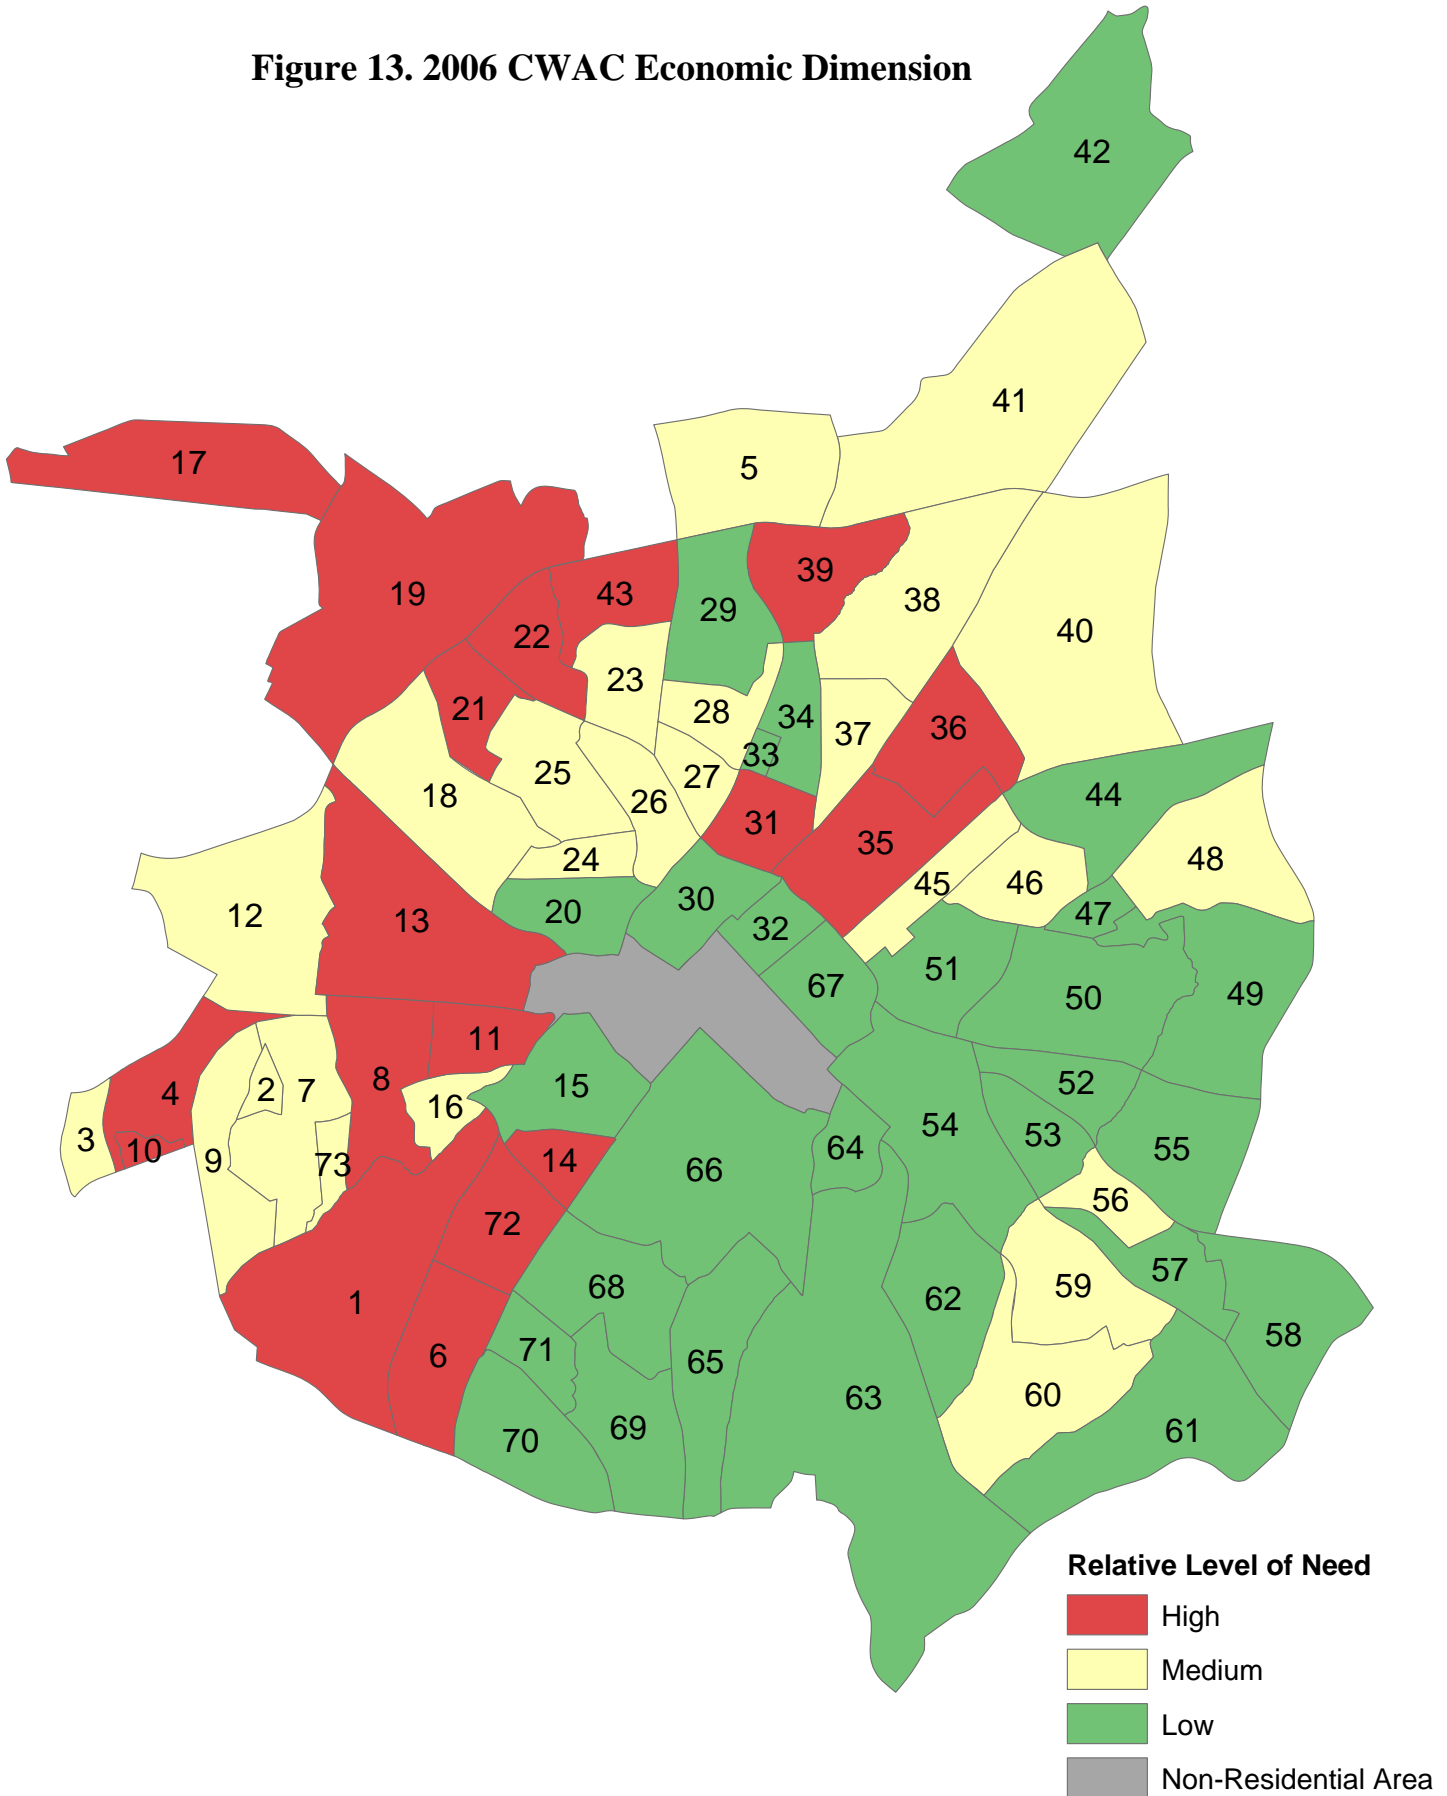

Results

With this framework, NSAs with low economic needs are communities that display strong positive economic trends, higher than citywide norms; whereas, NSAs with the highest economic needs have slow growing or stagnant economic characteristics. The economic dimension findings are displayed in Figures 13 and 14.

Among all NSAs, 75 were classified as have low economic needs, 79 were classified as having medium economic needs, and 19 were classified as having the highest economic needs. Geographically, the low need NSAs are concentrated in the southeastern quadrant of CWAC and extend to the suburban edge. Medium level economic need NSAs are clustered around the urban core, especially in the north and west, as well as, NSAs in the northern and eastern parts of Charlotte. The NSAs with the highest level of economic need are predominately found in the northern and western portions of CWAC.

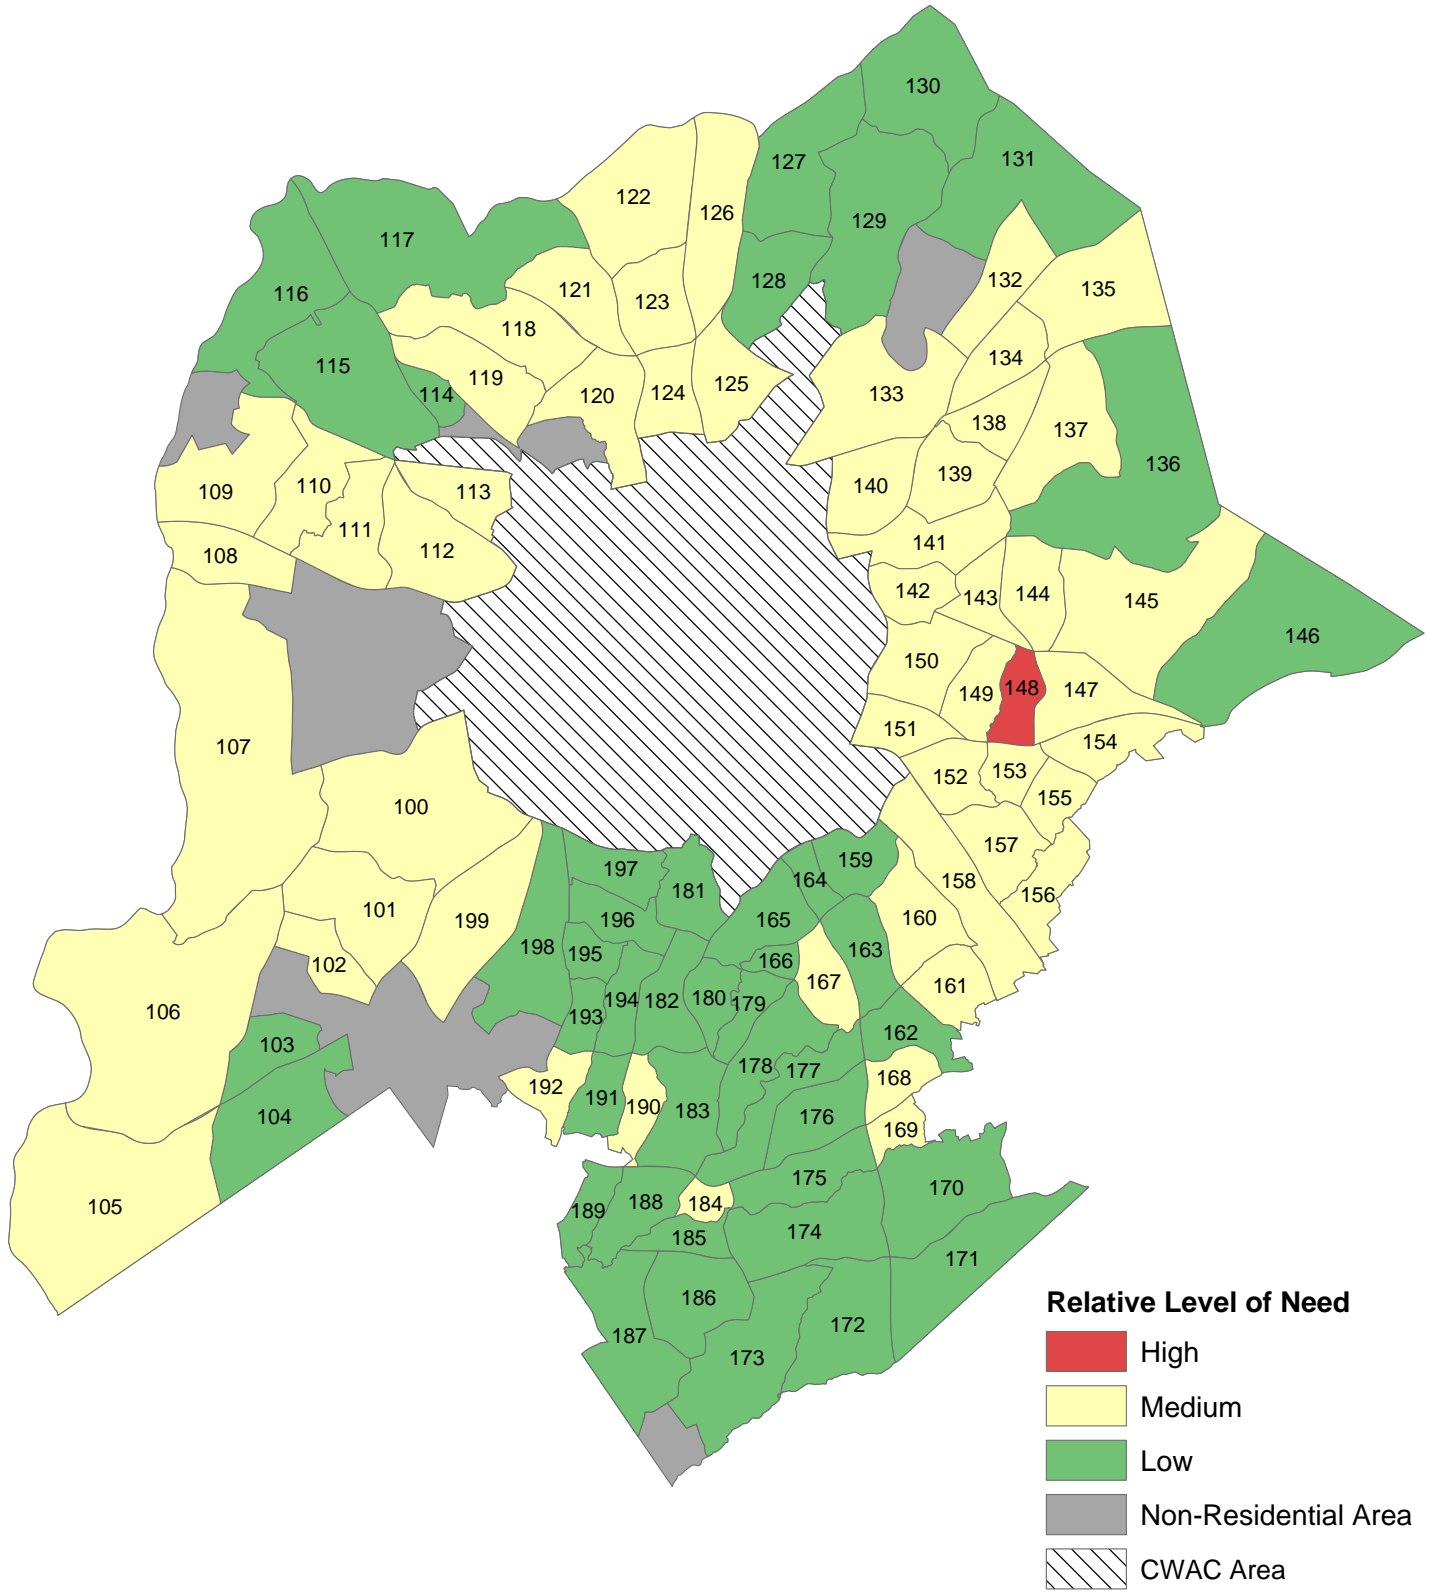

Growing income levels and increases in property values throughout the community sustain the prosperity and quality of life of all residents of Charlotte. Early detection of potential economic instability can help city officials and residents to work together to strengthen neighborhood education and job-training resources. The quality of life indicators will help city officials to take a proactive approach to creating and maintaining economically vital neighborhoods in all parts of the community.

Introduction

Planners and social scientists have long noted that neighborhoods evolve and change as they move from initial development and occupancy to a mature state. The nature of these adjustments is both social and physical. In Charlotte, the city has developed a strategic process and policy framework to monitor neighborhood trends, and, as necessary, take actions to guard the negative effects that can accompany neighborhood maturation and change.

The Charlotte Neighborhood Quality of Life is a tool that has been designed to measure neighborhood trends. The community elements used in the analysis are structured around quantitative measures that can be directly or indirectly influenced by local government actions or policies. In this way, the study is focused on examining neighborhood change that is affected by deliberate public intervention, rather than change processes that are beyond public impact.

Methodology

As a component of the study, the 2002 and 2006 Charlotte Quality of Life Studies were utilized for analyzing NSA trends. A four-year analysis timeframe was selected in order to allow for adequate trends in the data. A shorter timeframe risks missing slower developing neighborhood change. It may also capture isolated perturbations in data that may be treated as trends. An alternative timeframe of six years was judged to be too long and missed the purpose of assessing meaningful NSA change in a timely fashion.

At the center of the analysis was a comparison between the two time periods for each variable used in the quality of life analysis. The 17 common variables employed in both periods were examined. Significant changes, either improvements or declines in variable scores, were recorded. Each NSA was subsequently grouped into one of three categories based upon the cumulative variable performances. NSAs experiencing significant improvement in individual variable performance and cumulative positive change in variable scores are labeled “trending up”. Those NSAs showing modest or slight changes in individual and cumulative variable scores are labeled “no change”. Finally, the NSAs where individual variables and cumulative variable performance are declining are labeled “trending down”.

Results

Among the 173 NSAs, 86 were classified as “trending up,” 74 were in a “no change” group, and 13 were labeled as “trending down”. These results are presented in Figures 15 and 16.

Geographically, the NSAs with improving quality of life rankings are found throughout the city. This is a positive finding that affirms the citywide scope of efforts to guard against neighborhood deterioration. A majority of the inner city CWAC neighborhoods were in the “trending up” category. East Charlotte and southeast Charlotte also exhibited large concentrations of “upward trending” NSAs. A similar pattern was also evidenced for the “no change” category. These NSAs were located throughout the city. The one quadrant of the city that had the greatest concentration of “no change” NSAs was West

Charlotte. The “downward trending” NSAs were spatially concentrated in two areas. The largest number of these NSAs were found in northeast Charlotte, followed by northwest Charlotte.

Beginning with the 2006 Quality of Life Study, the NSA results will be calculated in all future updates. In addition, the trend information will be included on the individual NSA profile pages. These are provided in Appendix A and use the following symbols:

	Trending Up
	No Change
	Trending Down

Neighborhood Profiles

Neighborhood Profiles

The following section presents a quality of life profile for each of the 173 NSAs in this report. The profile is intended to provide a “snapshot” of each community as well as a perspective on how an NSA stands in comparison to citywide averages. Each Individual profile contains:

- Cumulative quality of life rating;
- Quality of life level of need for each dimension (Social, Crime, Physical, Economic);
- NSA Trend from 2002-2006
- Statistical background data on the NSA;
- NSA location map;
- Individual neighborhood data for each of the 20 variables used in the analysis with comparable citywide data for the same variables. In cases where citywide data could not be calculated or were inappropriate, values were not provided;

The detailed statistical data that are used to compile this profile are described in Appendix B of this report. A complete reporting of all of these data by all NSAs is contained in the technical document that accompanies this report.

Percent of Persons with Access to Basic Retail	9.8%	18.0%
Pedestrian Friendliness Index	Low	Low

Economic

Percent of Persons Receiving Food Stamps	2.6%	8.7%
Percent Change in Income	3.4%	1.1%
Percent Change in House Value	1.3%	1.2%

For a detailed discussion of individual variables and their interrelationships, see the Neighborhood Profile User Guide (Appendix B).

Appendix B
Neighborhood Profiles: User Guide

Statistical Background Data

Population -The total population of the neighborhood.

Source: Mecklenburg County Property Records and Land Management, 2005; Claritas, 2005; United States Census Bureau, 2000.

Youth Population -Youth population of the neighborhood.

Source: Mecklenburg County Property Records and Land Management, 2005; Claritas, 2005; United States Census Bureau, 2000.

Number of Housing Units - The number of residential housing units for each neighborhood.

Source: Mecklenburg County Property Records and Land Management, 2005.

Area (Acres) - The area of the neighborhood in acres.

Source: Charlotte-Mecklenburg Planning Commission, 2005.

Median Household Income - The median household income using Census Block Group statistics.

Source: Claritas, 2005.

Average House Value - The 2005 sales value for single-family homes, condominiums, and townhouses average for each neighborhood.

Source: Mecklenburg County Property Records and Land Management, 2005.

Neighborhood Organizations – The total number of neighborhood organizations for each neighborhood was identified.

Source: Neighborhood Development, 2003.

Unemployment Index – For each zip code in Charlotte, the number of people applying for unemployment benefits were totaled for the months of July 2005 through December 2005. This total was divided by the number of persons able to work. The resulting number was indexed based on the following:

- 0 – 2.5% - Low
- 2.5% - 4% - Medium
- 4% - 7.5% - High

The resulting index was assigned to each neighborhood that fell in the respective zip code's boundary.

Source: Employment Security Commission of North Carolina, 2005.

Social Dimension

Percent of Persons over Age 64 - The proportion of the population that is 65 years and older.

The total number of people 65 years and older and the total overall population were compiled for each neighborhood. Subsequently, the total number of aged persons 65 years and older was divided by the total population for each neighborhood.

Source: Claritas, 2005.

Average Kindergarten Score – An average achievement score was calculated for each kindergarten student at the end of the year. These scores include math and verbal scores.

The achievement scores for all kindergarten students were averaged for each neighborhood.

Source: Charlotte-Mecklenburg Schools System, 2005.

Dropout Rate – Percentage of high school students who dropped out of school.

The total number of high school students and the total number of students who dropped out were compiled for each neighborhood. The total number of high school students who dropped out was then divided by the total number of high school students.

Source: Charlotte-Mecklenburg School System, 2005.

Percent of Children Passing Competency Exams – Percentage of ninth grade students passing the required competency exams.

The total number of ninth grade students and the total number of ninth grade students who passed required competency exams were compiled for each neighborhood. Total number of ninth grade students who passed was then divided by the total number of ninth grade students.

Source: Charlotte-Mecklenburg School System, 2005.

Percent of Births to Adolescents - Percent of children born in 2004 to women 18 years and younger.

The total number of births and the total number of births to adolescents were compiled for each neighborhood. Total births to adolescents were then divided by the total births.

Sources: Mecklenburg County Health Department, Birth Certificate Data, 2004.

Youth Opportunity Index - A measure of the potential opportunities for youth to get involved in extra-curricular activities within the neighborhood.

“Opportunities” were defined as sites within the neighborhood that offered programs and activities for youth up to age 18. These sites included YMCA/YWCAs, churches, schools offering before and/or after school programs, recreation centers, community centers and libraries. These locations were scored as follows:

- Churches—Because churches provide services beyond their neighborhood boundaries, each church was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the church. Each church was given a score of 1, which was a minimal score for potential activity center. Each residential unit captured by the buffer zone was assigned a score of 1.
- Schools—Schools were given a score of 1 for a before-school program and a score of 1 for an after-school program. The highest score possible for a single school was 2 for having both programs. Because these schools provided services beyond their neighborhood boundaries, each school was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the school. Each residential unit captured by the buffer zone was assigned a score of based on the programs provided by the adjacent school
- Recreation Centers, Community Centers and YWCA/YMCAs—Because these centers provide services beyond their neighborhood boundaries, each center was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the center. Each center was given a score of 3. This value was assigned to every residential unit within the buffer zone.
- Libraries—Libraries were scored using the same methodology as the centers. However, a library was given a score of 2, indicating that it potentially offered greater services than a church but fewer than a Recreation Centers, Community Centers or YWCA/YMCAs. Each residential unit that fell in the buffer zone was assigned a score of 2.

Each residential unit within a neighborhood had the potential of receiving a score ranging from 0 to 8. The score for each neighborhood was calculated based the average youth opportunity score for each residential unit. This composite score represents the total number and types of opportunities available to youth.

0.0 - 0.09	<i>Low Youth Opportunity</i>
0.09 - 0.90	<i>Medium Youth Opportunity</i>
1.00+	<i>High Youth Opportunity</i>

Crime Dimension

Violent Crime Rate - The violent crime rate in each neighborhood as compared with the violent crime rate in the City of Charlotte.

The locations of violent crime offenses between July 2004 and June 2005 were summarized for each neighborhood and the City of Charlotte. For the purpose of this study, violent crimes include homicides, rapes, robberies, and aggravated assaults defined according to UCR (Uniform Crime Report) standards.

The number of violent crime incidents for each neighborhood and the City of Charlotte were divided by their respective populations to get the violent crime rate for each neighborhood and the City of Charlotte.

The Location Quotient method was used to compare the neighborhood and city wide rate. The method gives a measure of the share of all violent crime in the City of Charlotte captured by the individual neighborhood. Thus, a score of 2.00 indicates that the particular neighborhood has a violent crime rate that is twice the rate in the city; while a score of 0.5 shows that the neighborhood violent crime rate is one-half the rate of the entire city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2005.

Juvenile Arrest Rate - The juvenile arrest rate in each neighborhood as compared with the juvenile arrest rate in the City of Charlotte.

The locations of juvenile arrests between July 2005 and June 2005 were summarized for each neighborhood and the City of Charlotte. For the purpose of this study, juvenile arrests are based on individuals arrested under the age of 16. This definition is based on North Carolina state statutes which generally define a juvenile offender according to this age definition.

The number of juvenile arrest incidents for each neighborhood and the City of Charlotte were divided by their respective juvenile populations to get the juvenile arrest rate.

The Location Quotient method was used to compare the neighborhood and city wide rate. The method gives a measure of the share of all juvenile arrests in the City of Charlotte captured by the individual neighborhood. Thus, a score of 2.00 indicates that the particular neighborhood has a juvenile arrest rate that is twice the rate in the city; while a score of 0.5 shows that the neighborhood juvenile arrest rate is one-half the rate of the entire city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2005.

Property Crime Rate - The property crime rate in each neighborhood as compared with the property crime rate in the City of Charlotte.

The locations of property crime offenses between July 2004 and June 2005 were summarized for each neighborhood and the City of Charlotte. For the purpose of this study, property crimes include burglaries, larcenies, vehicle thefts, arsons, and vandalisms defined according to UCR (Uniform Crime Report) standards.

The number of property crime incidents for each neighborhood and the City of Charlotte were divided by their respective populations to get the property crime rate.

The Location Quotient method was used to compare the neighborhood and city wide rate. The method gives a measure of the share of all property crime in the City of Charlotte captured by the individual neighborhood. Thus, a score of 2.00 indicates that the particular neighborhood has a property crime rate that is twice the rate in the city; while a score of 0.5 shows that the neighborhood property crime rate is one-half the rate of the entire city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2005.

Crime Hot Spots – The proportion of a neighborhood that has a durable concentration of violent crime.

For the purpose of this study, the crimes compiled in the hotspot analysis were violent crimes including homicides, rapes, robberies, and aggravated assaults defined according to Part I and Part II offense categories as defined by Uniform Crime Reporting standards with the inclusion of missing persons and hit-and-runs. A density grid was created from the violent crime point data using a 250' cell size, a 1500' search radius, and the kernel method. Cells with a density greater than 3 standard deviations above the mean of the grid were considered hot cells. Locations with 5 or more overlapping, monthly hotspots were considered durable hotspots and flagged to be included to calculate final hotspot values for each NSA.

The total number of durable hot cells was divided by the total number of cells for each neighborhood to get the proportion of a neighborhood that is considered a durable violent crime hotspot. For instance, a value of 0.9 indicates that 90% of the particular neighborhood is covered by a durable violent crime hotspot; while a value of 0 indicates that no part of a neighborhood is a durable violent crime hotspot.

Source: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2005.

Physical Dimension

Appearance Index – Percentage of appearance code violations for each neighborhood.

The violations recorded from November 2004 to October 2005 were summarized for each neighborhood. The number of documented violations was divided by the total number of parcels in the neighborhood.

Source: Neighborhood Development, 2005.

Housing Code Index - Percent of housing units in a neighborhood with housing code violations.

The violations recorded from November 2004 to October 2005 were summarized for each neighborhood. The number of documented violations was divided by the total number of housing units in the neighborhood.

Source: Neighborhood Development, 2005.

Home Ownership - Percentage of owner-occupied residential units.

By utilizing the tax parcel database, the number of owner-occupied units and total occupied units were compiled for each neighborhood. The owner-occupied units were divided by the total occupied-units.

Source: Mecklenburg County Property Records and Land Management, 2005.

Projected Infrastructure Improvement Costs – Estimated public construction costs for sidewalk, curb, and minor drainage, not including any funds for the repair or installation of major drainage systems.

The total area of the neighborhood is calculated in square miles. The estimated construction costs were divided by the total area to get the infrastructure cost per square mile for each neighborhood.

Source: Charlotte Engineering and Building Maintenance Department Assessments, 2005.

Percent of Persons with Access to Public Transportation – The percentage of neighborhood residents, who live within walking distance of public transportation, using the Charlotte Area Transit System bus stops.

By utilizing the tax parcel database, the total number housing units and the total number of housing units within ¼ mile of a bus-stop were compiled for each neighborhood. The transit accessible housing units were divided by the total number of housing units.

Source: Charlotte Area Transit System, 2005.

Percent of Persons with Access to Basic Retail Facilities – The percentage of neighborhood residents that are within walking distance to a grocery store and/or a pharmacy.

By utilizing the tax parcel database, the total number housing units and the total number of housing units within ¼ mile of a grocery store and/or pharmacy were compiled for each neighborhood. The retail accessible housing units were divided by the total number of housing units.

Sources: Mecklenburg County Property Records and Land Management, 2005.
BellSouth Yellow Pages, Charlotte, 2005.

Pedestrian Friendliness Index – The pedestrian friendliness based on the total length of sidewalks in each neighborhood as compared to the total length of the streets. Index values could rank from 0-2.0. The index score were scaled using the following qualitative ranking.

- 0.0 - 1.0 Low Pedestrian Friendliness
- 1.1 - 1.3 Medium Pedestrian Friendliness
- 1.4 + High Pedestrian Friendliness

Source: Charlotte Department of Transportation, 2005.

Economic Dimension

Percent of Persons Receiving Food Stamps - The percent of people in a neighborhood who were receiving Food Stamps.

The number of people receiving food stamps was divided by the neighborhood population.

Sources: Mecklenburg County Department of Social Service Office of Planning and Evaluation, 2005.

Percent Change in Income – Percent increase or decrease in median household income from 1999 to 2005 per year. The following equation was used:

$$\frac{2005 \text{ income} - 1999 \text{ income}}{1999 \text{ income}} * 100 = \% \text{ Change in Income}$$

Source: Claritas, 2005; Census 2000.

Percent Change in House Value – Percent change in residential house value per year was calculated using the following equation:

$$\frac{2005 \text{ sales value} - 2003 \text{ assessed value}}{2003 \text{ assessed value}} * 100 = \% \text{ Change in House Value}$$

Source: Mecklenburg County Property Records and Land Management, 2005.

Appendix D

CWAC Analysis

CWAC Neighborhoods

The two earliest neighborhood quality of life studies were focused exclusively on the 73 neighborhoods comprising the City Within a City (CWAC). As a consequence the quality of life indices developed for 1993 and 1997 did not contain the newer and most suburban communities in Charlotte.

Beginning in 2000, the CWAC geography was replaced by the larger, more comprehensive neighborhood statistical area (NSA) framework. Within this framework, all analyses of neighborhood quality of life were structured to reflect citywide measurement rather than inner city or suburban boundaries.

With this background, the merger of the older 73 CWAC neighborhoods with newer 100 NSA communities is the most relevant neighborhood framework for planning and program evaluation purposes. However, to the extent that CWAC remains a concern for Charlotte's neighborhood development policy-makers and staff, it is useful that we continue to monitor the state of neighborhood quality of life in the CWAC areas. Accordingly, a separate statistical analysis was performed on the CWAC communities. These findings are presented in the following map and table.

The number of stable communities within CWAC has grown significantly, from 24 in 1997 to 35 in 2006. Conversely, there has been a decline in challenged neighborhoods from 15 to 9. Although the number and composition of the quality of variables has changed between the 1997 and 2006, thus making direct comparison impossible, the strategic shift to stable neighborhoods supports the conclusion that CWAC neighborhoods are making substantial strides in community quality of life. Figure 1 shows the CWAC only analysis results for 2006.

Figure 1. 2006 CWAC Neighborhood Rankings
