Introduction

Fifteen years ago, the City of Charlotte has pioneered a policy of monitoring neighborhood level quality of life and taking proactive actions to protect and improve these basic building blocks of the city. Starting with the publication of the City Within A City (CWAC) Neighborhood Assessment in 1993, city leaders and policy makers have had a document that enabled them to take a detailed look at the issues that need to be addressed in order to maintain and improve neighborhood vitality. Over time, the 'Charlotte Model' for assessing community change has earned national and international recognition and been used as a prototype for numerous cities.

In 1997, the Neighborhood Assessment was followed by the CWAC Neighborhood Quality of Life Index. This study evaluated the quality of life in 73 inner city neighborhoods through an analysis of a wide ranging set of variables. In turn, these variables were aggregated into social, physical, crime, and economic dimensions that were combined to create a quality of life index or score for each neighborhood. Individual neighborhoods were labeled Stable, Threatened, or Fragile, based upon the cumulative variable scores. The data presented in that study offered a baseline of information that enabled the city to carry out an ongoing review of neighborhood level quality of life. The index study was intended to serve as a benchmark, a first step in an ongoing program to monitor progress toward the goals of sustaining and renewing the neighborhoods of CWAC.

In 2000, the Charlotte Neighborhood Quality of Life Study expanded the geographical scope of the earlier inner city analysis. It evaluated the quality of life in 173 neighborhood statistical areas (NSAs) covering the entire city and the city's Sphere of Influence. The 2000 study constructed an index measurement using 19 locally based variables that measured neighborhood social, physical, and economic conditions. The most important improvement of this study was that it offered a citywide baseline for measuring cumulative and individual changes in NSAs in the future.

The Charlotte Neighborhood Quality of Life studies in 2002 and 2004 closely followed the framework and format of the 2000 report. The composition of study variables changed slightly in order to strengthen the rigor of the statistical analysis.

In 2006, the Charlotte Neighborhood Quality of Life study, changed the nomenclature for classifying NSAs. The terms Stable, Threatened, and Fragile which were used in every report since 1993 are changed to Stable, Transitioning, and Challenged. The research

methodology used to classify NSAs was not changed. The shift in classification was made in order to better describe what the research findings are reporting.

This report, Charlotte Neighborhood Quality of Life 2008, replicates and builds upon the research framework established in the three previous iterations of this process. This study continues the evaluation of neighborhoods through measurement of a set of community-centered variables. These variables are generally locally based and have remained unchanged in the way they are measured. This allows for longitudinal analyses of a NSA growth and change.

This study continues to offer detailed intra-neighborhood analysis, but expands the detail of this information. A detailed analysis of NSA change over time is also included in this report. It presents how each variable changes, by neighborhood, over a six year period of time. These data are displayed in Appendix C: NSA Trend by Variable.

As in the past, this report includes a neighborhood profile page for each NSA. Appendix A presents these profiles. The profile includes quality of life rankings, background statistics, and the individual descriptive data for each of the 20 variables used in the quality of life analysis along with their comparable citywide data.

Defining Quality of Life

Quality of Life can mean many things to different people. One of the most critical challenges is how to correctly and efficiently measure the concept. Many academics and planners maintain that in order for a community to enjoy a high level of quality of life, residents should feel safe from crime, live in affordable and safe housing, and should have access to good quality education and employment. Indeed, these are basic expectations for a livable community. They transcend economic status, age, race or ethnicity, household composition, or any other demographic marker.

Beyond the basic factors, there are many more subjective ideas, often framed by local or regional constructs, about what makes a neighborhood a good place to live. These ideas often revolve around the structure of a neighborhood or the lifestyle of the residents. Urban, suburban, or rural settings may translate into different scales or different ideas about what constitutes quality of life.

Despite challenges, many cities and regions throughout North America and Europe are developing locally-based measures to assess quality of life. Studies such as the *Providence Neighborhood Fact Book, Jacksonville Quality-of-Life Report, Sustainable Indicators in Seattle, Sustainable Pittsburgh*, and the *Boston Indicators Project* are commonly cited prototypes. The Washington DC-based Urban Institute has been working with a select group of U.S. cities on a "National Neighborhood Indicators Project" which compiles and documents the use of additional neighborhood-level evaluation systems around the U.S. Taken together, over 200 American communities have examined or implemented quality of life studies. Some have collected measures of quality of life incorporating local, environmental, social, and economic conditions. But most communities have relied on published data from the U.S. Census Bureau to measure quality of life.

The notion of quality of life as a multi-faceted concept includes a wide variety of critical factors that operate within a unified framework. In this case, the Charlotte neighborhood quality of life research model defines neighborhood quality of life as a nexus where social well being, physical characteristics, crime, and economic vitality are all considered. In all, 20 variables make up this quality of life composite (Table 1). A detailed description of each of these factors is contained in Appendix B, Neighborhood Profiles: User Guide. The selection of the individual variables was made following extensive discussion and consultations with the sponsoring organizations and staff from the cooperating city and county partners.

Methods

The findings reported in this study were derived from a statistical analysis of 20 variables collected for 173 Neighborhood Statistical Areas (NSAs). All of the variables used in the analysis are structured around locally sourced data. Only "Percent of Persons over Age 64" and "Percent Change in Income" are partially derived from Claritas data, a nationally regarded demographic and marketing firm. Within this framework, the 20 variables were organized into four groups representing the major dimensions that comprise local quality of life. These four dimensions are social, physical, crime, and economic.

The data were standardized prior to calculating quality of life scores. The standardization was done by computing the mean value for the NSAs on each of the 20 variables. The mean measure for each variable was assigned a value of zero and each NSA score was expressed in terms of the number of standard deviations above or below the mean (Z scores). This procedure converts all variables to the same unit and allows NSA scores to be combined in order to derive an overall or composite score based on multiple variables. In selected cases, the variables used in the analysis were inverse measures of the quality of life, so that, a high value may indicate a low quality of life condition. The signs of the Z scores for these variables were reversed before summing scores for several variables to derive an overall or cumulative score for the quality of life.

Following standardization, individual quality of life scores were calculated for each NSA and for each of the four groups of variables. The composite score was then determined for each neighborhood using the four dimensions (social, physical, crime, and economic) by summing the Z scores of the individual variables. Once the composite Z scores were determined on a dimension for the NSAs, these scores were standardized again, i.e. each neighborhood's score was expressed in terms of the number of standard deviation units above or below the mean. Consequently, a high positive score indicated a positive quality of life condition in the NSA.

Finally, an overall or composite quality of life index for each NSA was calculated by summing the four dimensions. In computing the overall index, the four dimensions were weighted in the following manner: social, 30%; physical, 30%; crime, 30%; and economic, 10%. These scores were standardized by setting the mean value to zero and expressing each neighborhood's score in standard deviation units above or below the mean. Therefore, large positive scores indicate a relative high quality of life, while large negative scores reveal a relative low quality of life.

In addition to the citywide analysis using the 173 NSAs, the same procedure was employed to determine quality of life scores for the CWAC neighborhoods as a separate group. This analysis is presented in Appendix F, labeled CWAC Analysis.

A companion document, **Charlotte Neighborhood Quality of Life Technical Report 2008**, contains the complete set of data for all individual variables, as well as, maps displaying the distribution of variables across NSAs.

Geographic Units

The quality of life analysis is applied to 173 NSAs encompassing all of the City of Charlotte and its Sphere of Influence (Figure 1). The only exclusions are seven non-residential areas that have no expected residential future. Therefore, these areas are not included in the NSA framework. The NSA boundaries are delineated by the Charlotte-Mecklenburg Planning Commission. These neighborhood scale geographies have been used by the Planning Commission and other city and county staff for a variety of community-based initiatives.

The CWAC geography is structured around 73 inner city neighborhoods. These boundaries roughly follow 1990 U.S. Census block group and block boundaries (Figure 2). Table 2 lists the CWAC neighborhood name and NSA number. In developing the CWAC neighborhood boundaries, the Planning Commission staff devised alignments that best matched communities of interest. Existing neighborhood organizations and community groups offered guidance and advice on where their boundaries should be drawn. While the advice of every community group border was not always followed, efforts to select the best set of boundaries were made.

Outside the CWAC area, Planning Commission staff delineated neighborhood centered units for the more suburban residential areas in Charlotte and its Sphere of Influence in 2000 (Figure 3). Again, 1990 U.S. Census block group and block boundaries were utilized as guides. In most cases, individual NSAs were comprised of multiple residential subdivisions. In preparation for the 2010 Census of Population, the US Census Bureau is in the process of redesigning smaller neighborhood geographic boundaries. These revised boundaries will be utilized in future Quality of life reports.

In 2008, one minor NSA boundary adjustment was made to incorporate new residential growth that had been left out of the original 2000 delineation. This change did not have any significant impact of the analyses used in this report. Future changes in NSA boundaries will be minimal and take place only when neighborhood conditions warrant action. This "fixed boundary" rule is used in order to allow comparisons of neighborhoods over time.

A list of neighborhood names and NSA numbers are provided in Table 3. Since individuals and communities have different perceptions of neighborhood boundaries and name identification, some neighborhoods may have multiple ways of being identified.

NSA Name Changes

In 2000, when the Neighborhood Quality of Life Study was expanded to the current 173 NSAs, 100 new neighborhoods and "communities of interest" were added to the study framework. These new NSAs were not formally named until the 2004 Quality of Life study. Subsequently, neighborhood organizations within the newly defined NSAs have been given the opportunity to recommend name changes. The reason for suggested NSA name changes varies. In most cases, a neighborhood name was assigned to the NSA that did not represent the entire area within the NSA. Therefore, the name was changed to represent a general geographic area within Charlotte, often referencing street intersections or a historical name. In addition, some NSA names within the traditional CWAC geography were also modified to better represent the area they incorporate. Below is a list of NSAs that were identified under a different name in earlier reports.

NSA	Original Name	New Name
1	Clanton Park	Clanton Park / Roseland
103	The Crossings	Brown Road
122	Wedgewood	North Lake
139	Autumnwood	Newell South
145	Silverwood	Robinson Church Road
149	Wilora Lake	Eastland / Wilora Lake
152	Coventry Woods	North Sharon Amity / Reddman Road
196	Closeburn / Glenkirk	Montclaire / Madison Park

Stable, Transitioning, and Challenged Neighborhoods

The Charlotte Neighborhood Quality of Life research model is built around a comprehensive assessment of community level quality of life. Within this framework, the individual variables are organized into four dimensions: social, physical, crime and economic. In turn, these dimensions are aggregated into a cumulative quality of life index. Based upon this numeric value, NSAs are classified into three groups: Stable, Transitioning, and Challenged.

Arranging the NSAs into categories is a useful approach for creating a general template that can convey the idea of quality of life at a small, localized scale. Moreover, it permits a comparison of the quality of life between NSAs, as well as, within the entire city. However, this general three part categorization formula should only be used to assess a generic level of need in a community. Each NSA is unique. Accordingly, each NSAs score on an individual dimension and individual variables should be regarded as more useful to assessing the specific conditions and needs of that NSA.

In broad terms, the categories Stable, Transitioning, and Challenged reflect community conditions relative to other NSAs. As a measure for separating local inter-NSA quality of life, the terms translate into the following broad standards.

Stable: NSAs that exhibit few neighborhood level problems. These are neighborhoods that score high on the social, physical, crime, and economic dimensions. Compared to other NSAs, the Stable grouping has a significant higher quality of life than the city average conditions.

Transitioning: These are NSAs that are around average on most dimensions, but also display a weakness on one or more of the dimensions. This pattern may be signaling a shift in the overall NSA quality of life. Transitional status can indicate an improving or declining position, relative to other Charlotte NSAs. Compared to all Charlotte NSA, the transitioning group is clustered around conditions.

Challenged: Challenged NSAs generally have low to moderate scores on some or all quality of life dimensions. A Challenged neighborhood has a lower quality of life than other communities in Charlotte and is "at risk" on multiple dimensions. This grouping represents below average quality of life compared to citywide values.

This study looks at the very broad issues in each community, as well as, detailed data. The specific variable values that are used to compile the rankings are contained in the **Charlotte Neighborhood Quality of Life Technical Report 2008.**

2008 Citywide Quality of Life Results

The quality of life experienced by residents in a particular area can vary from person to person. Because of the individuality of the concept, quantifying the meaning and rating local conditions is a complex task. Nonetheless, in order to assess what makes a community a desirable, safe, and socially healthy place to live, it is necessary to reduce the complex idea of quality of life to a manageable set of measurable information. This information can, in turn, be used to assess community characteristics and improve neighborhoods across the city.

For the Charlotte Neighborhood Quality of Life Study, a strong, healthy NSA has few social needs, low crime rates, low levels of physical deterioration, and low levels of economic stress. These are important aspects of any healthy community. However, these qualities do not occur independently. For example, neighborhoods with high crime rates typically have relatively high rates of social need or physical deterioration. This type of situation illustrates the need to address quality of life from many different perspectives, utilizing the talents and resources of many people and organizations in a cooperative effort with neighborhood residents.

Fundamentally, the distribution of strong residential communities across a jurisdiction is a key building block for a successful city. Acknowledging the interrelated issues of quality of life is the first step in creating a program to routinely assess progress toward healthy neighborhoods and focus efforts on strengthening the residential structure.

Among Charlotte's 173 NSAs, 90 were classified as Stable, 63 were classified as Transitioning, and 20 were classified as Challenged. These findings are displayed in Figure 4. Companion maps, presented as Figures 5 and 6, contain the results with the identifying NSA label numbers. The CWAC geography is shown in Figure 5, while the remainder of the city is covered in Figure 6. A table presenting the research results follows as Table 4.

A review of the 2008 Quality of Life results finds that earlier geographical patterns are persistent. The greatest concentrations of Stable NSAs were concentrated in southeast and southwest Charlotte, in neighborhoods around center city, and in NSAs around the edge of the city. Transitioning neighborhoods were generally clustered in the west Charlotte and the older suburban portions of east and northeast Charlotte. Challenged neighborhoods were concentrated in the west, northeast, and north sections of inner city Charlotte.

Citywide Quality of Life Changes: 2006-2008

A comparative review of the 2006 and 2008 citywide Quality of Life findings reveal several short-term findings. First, the number of NSAs in the below average group, Challenged NSAs, declined substantially from 24 to 20. At the other end of the scale, the number of NSAs in the Stable grouping, that is, neighborhoods substantially above average, grew slightly from 89 to 90. The middle group, Transitioning NSAs, increased from 60 to 63. Overall, the shifts between groupings during the past two years exhibited a general tendency for improving neighborhood quality of life. The positive movement of the individual variables pulled upward the citywide average measure for quality of life. In turn, NSAs exhibited stronger individual variable performance, with fewer extremely low scores among the variables.

Geographically, Charlotte's inner city NSAs displayed continuing quality of life improvement during the past two years. While persistently Challenged NSAs are concentrated in Charlotte's CWAC area, a number of inner city Challenged NSAs are moving into the Stable and Transitioning groupings. On the other hand, another shift during the past two years has been a pattern, wherein, older suburban NSAs are from Stable to the Transitioning group. This shift is most evident in east and northeast Charlotte.

One important caveat is that both comparative findings are reflective of only one cycle (two years) in the quality of life analyses. They should be considered as short tem observations, rather than trends or long term tendencies. Long-term findings are presented in other sections of this report.

Four Dimensions of Quality of Life

Measuring the quality of life in a large and diverse community, such as Charlotte, is a complicated and difficult task. The city's neighborhoods are diverse and continually changing. Because individual NSAs have such varied needs, it is necessary to assess their strengths and weaknesses from multiple perspectives. Recognizing that each place is unique, this study looks at each NSA from 20 different perspectives (variables) measuring community level quality of life across a wide array of factors. These perspectives are then aggregated into four broad, but core dimensions of quality of life. These are social, physical, crime, and economic dimensions.

The following four sections of this report, present the NSA level finding for each of these dimensions. **Charlotte Neighborhood Quality of Life Technical Report 2008**, a companion document for this study, contains the NSA level and citywide data for each of the 20 analysis variables.

Social Dimension

Overview

The social well being of a neighborhood is dependent upon many interconnected issues. Neighborhoods with a desirable quality of life are economically and socially diverse. They have healthy populations with a mix of older and younger residents. They are served by strong public schools and they have residents that are involved in their community. These neighborhoods provide strong role models for youth and opportunities for young people to be involved in a variety of after-school activities. The social vitality of a neighborhood is an important dimension of a comprehensive assessment of neighborhood quality of life.

Results

NSAs exhibiting the attributes listed above have low levels of social need. NSAs with some signs of social stress are classified as presenting a medium level of need. Lastly, NSAs experiencing social distress have the highest level of social needs. Individual NSA classifications, as well as the geographical pattern of the results are presented in Figure 7.

Among all NSAs, 81 display low levels of needs, 65 have medium levels of social needs and 27 are classified as having high levels of social needs. In general geographic terms, peripheral suburban NSAs display the lowest levels of social needs. In contrast, the greatest concentrations of NSAs with medium to high levels of social needs are geographically clustered in the north and westside CWAC neighborhoods and extend into the western and northeast areas of Charlotte.

In reviewing and interpreting the social dimension, it is critical to remember that individual NSA classifications reflect unique differences between NSAs, as well as, broader patterns of problems within communities. Consequently, it is important to acknowledge that variables are often related and

Photo courtesy of Charlotte-Mecklenburg Schools

do not act with complete independence. For example, low scores on competency exams are correlated with high rates of births to adolescents. Thus, related variables exhibiting similar scores signal a need to target specific populations or problem areas in an NSA.

Social need is only one component of neighborhood quality of life. Nevertheless, social distress tends to exacerbate the larger set of issues that affect the quality of life in communities with the greatest needs. In this regard, individual variables included in the quality of life study help to pinpoint specific problems and identify the type of organizations that are best qualified to address those deficiencies. By tracking specific scores over time, progress toward established goals can be assessed and communities strengthened.

07/28/2008
Crime Dimension

Overview

Crime rates play an integral role in the overall quality of life in an area. High rates of crime create undesirable and unstable living environments. This report measures various categories of crime in each NSA and compares these rates to a citywide average. By measuring crime rates between small geographic areas and the larger city area, it is easier to assess whether the criminal activity in an NSA is abnormally high, around average, or below the citywide norm.

Results

The crime dimension findings are displayed in Figure 8. Within the 173 NSAs, 106 present low levels of crime, 46 are classified as having medium levels of crime, and 21 are experiencing high levels of crime. In Charlotte, crime related needs are not geographically focused. With that said, generally higher levels of crime are spatially identifiable in northeastern and western CWAC neighborhoods and in adjoining NSAs. Those NSAs with medium levels of crime exhibit a different pattern. Spatially, they tend to be grouped in the northern portions of the older suburban NSAs in west and east Charlotte. One overall geographical finding is that communities impacted by high rates of criminal activity tend to be clustered together, rather than isolated from each other. Aside from these geographies, most Charlotte NSAs are characterized as having relatively low levels of crime.

In reviewing and interpreting the crime dimension, it is critical to remember that each NSA crime classification reflects unique differences between neighborhoods, as well as, the social and economic context within neighborhoods. Levels of crime are sometimes related to the physical or social conditions in a neighborhood. For example, NSAs with large numbers of businesses have higher concentrations of property crime, while areas that attract large numbers of youth have a greater problem with juvenile linked crime.

Photo courtesy of Charlotte-Mecklenburg Police Department

Crime is only one component of neighborhood quality of life. However, as crime rates increase and awareness grows, it takes increasing precedence in community assessments of neighborhood quality of life. Monitoring and tracking crime levels over time can assess progress toward measurable goals. Moreover, areas that have persistently high levels of crime can be targeted for special efforts.

Physical Dimension

Overview

The physical characteristics of a community are a visual cue to the level of social and economic distress experienced by neighborhood residents. Deteriorated housing stock or vacant and abandoned businesses indicate a neighborhood in trouble or at risk. Lack of maintenance of neighborhood structures weakens the social fabric of a neighborhood. In contrast, well-maintained public areas and infrastructure, attractive housing, and accessibility to basic retail establishments indicate a low level of stress—a desirable and safe place to live.

Results

Figure 9 contain the results of the physical dimension analysis. Overall, 86 NSAs are classified as having relatively low levels of physical need, 70 have medium levels of physical need, and 21 are classified as having relatively high levels of physical need. Neighborhoods with low levels of physical need were found throughout Charlotte. However, in general, there is a suburban orientation to these communities. NSAs with medium levels of physical need are clustered in Northeast and western Charlotte, with a disproportionate number found in the older inner city neighborhoods. Finally, NSAs with the highest levels of physical need are almost exclusively located in the CWAC, especially in the northwest and west quadrants.

Physical Dimension scores represent a composite assessment of the structure and character of the NSA. The condition of buildings, lots, and businesses sets the tone and helps formulate an image for a community. A well-kept community gives a sense of security to those who live in or visit a neighborhood.

The physical integrity of a neighborhood is important in maintaining the quality of life of residents. All citizens benefit from clean, safe environments. Therefore, assessing the overall level of physical stress in a neighborhood is a necessary prerequisite to organizing strategic plans for improving conditions.

Economic Dimension

Overview

The economic vitality and character of a neighborhood are among the most commonly cited quality of life indicators. Often, household income is used as a primary metric to assess quality of life. When this is done, the evaluation of economic condition can easily become biased toward high wealth neighborhoods. This report looks at a different measure of economic vitality, one which is less biased toward higher income communities. It uses three variables that broadly measure economic status. They are the "Percent Change in Income", "Percent of Persons Receiving Food Stamps", and "Percent Change in House Value".

Results

With this framework, NSAs with low economic needs are communities that display strong positive economic trends, higher than citywide norms; whereas, NSAs with the highest economic needs have slow growing or stagnant economic characteristics. The economic dimension findings are displayed in Figure 10.

Among all NSAs, 87 were classified as have low economic needs, 56 were classified as having medium economic needs, and 30 were classified as having the highest economic needs. Geographically, the low need NSAs are concentrated in neighborhoods around center city, in the southeast quadrant, and circle around the suburban edge of Charlotte. Medium level economic need NSAs are clustered around the urban core, especially in the north and west, as well as, in the northeast and northwest Charlotte, including CWAC and non-CWAC geographies. Finally, the NSAs with the highest level of economic need are predominately found in north and northwest CWAC NSAs.

Growing income levels and increases in property values throughout the community sustain the prosperity and quality of life of all residents of Charlotte. Early detection of potential economic instability can help city officials and residents to work together to strengthen neighborhood education and job-training resources. The quality of life indicators will help city officials to take a proactive approach to creating and maintaining economically vital neighborhoods in all parts of the community.

Introduction

Planners and social scientists have long noted that neighborhoods evolve and change as they move from initial development and occupancy to a mature state. The nature of these adjustments is both social and physical. Neighborhood demographics shift as neighborhood children grow up and move away and new residents move in. Crime rates fluctuate over time as police target neighborhoods to reduce crime. Physical conditions can change when neighborhoods are targeted for revitalization and overall housing conditions improve. Economic conditions can improve as new development brings in households with different income levels.

Although some factors affecting neighborhood quality of life are locally driven, other external forces and trends can play major roles. Both sets of factors need to be considered when assessing and evaluating neighborhood change.

In Charlotte, the city has developed a strategic process and policy framework to monitor neighborhood trends, and, as necessary, take actions to guard the negative effects that can accompany neighborhood maturation and change.

The Charlotte Neighborhood Quality of Life is a tool that has been designed to measure neighborhood trends. The community elements used in the analysis are structured around quantitative measures that can be directly or indirectly influenced by local government actions or policies. In this way, the study is focused on examining neighborhood change that is affected by deliberate and strategic public intervention, rather than change processes that are beyond public impact.

In addition, this analysis provides another layer of information about how neighborhoods change beyond the classification of Stable, Transitioning, and Challenged. In this way, it is possible to measure improvements or declines with more precision. Shifts between the broad categories, Stable, Transitioning, and Challenged, reflect large scale trends. Smaller scale adjustments are captured in this change analysis

Methodology

As a component of the study, the 2002 and 2008 Charlotte Quality of Life Studies were utilized for analyzing NSA trends. A six-year analysis timeframe was selected in order to allow for adequate trends in the data. A shorter timeframe risks missing slower developing neighborhood change. It may also capture isolated adjustments in data that should be treated as trends.

At the center of the analysis was a comparison between the two time periods for each variable used in the quality of life analysis. Fourteen common variables employed in both periods were examined. Significant changes, either improvements or declines in variable scores, were recorded. Each NSA was subsequently grouped into one of three categories based upon the cumulative variable performances. NSAs experiencing significant improvement in individual variable performance and cumulative positive change in variable scores are labeled Trending Up. Those NSAs showing modest or slight changes in individual and cumulative variable scores, either improving or declining, are labeled

No Change. Finally, the NSAs where individual variables and cumulative variable performance are declining are labeled Trending Down.

Results
Among the 173 NSAs, 78 were classified as Trending Up, 82 were in a No Change group, and 13 were labeled as Trending Down. These results are presented in Figures 11 and 12.

Geographically, the NSAs with improving quality of life rankings are found throughout the city. This is a positive finding that affirms the citywide scope of efforts to guard against neighborhood deterioration. A majority of the inner city CWAC neighborhoods were in the Trending Up category. Southeast Charlotte also exhibited large concentrations of upward trending NSAs. A similar pattern was also evidenced for the No Change category. These NSAs were located throughout the city. The two quadrants of the city that had the greatest concentration of No Change NSAs were east and west Charlotte. The Trending Down NSAs were spatially concentrated in two areas. The largest number of these NSAs were found in east Charlotte, followed by west Charlotte.

The trend information will be included on the individual NSA profile pages. These are provided in Appendix A and use the following symbols:

⬆	Trending Up
⬌	No Change
⬇	Trending Down

The change for each variable from 2002 to 2008 is included in the report to allow users to track the change of each variable for each NSA in Charlotte. Individual variable trend information is displayed in Appendix C.

Neighborhood Profiles

Neighborhood Profiles

The following section presents the Charlotte Neighborhood Quality of Life profile for each of the 173 NSAs in this report. The profile is intended to provide a "snapshot" of each community as well as a perspective on how an NSA compares to citywide averages. Each individual profile contains:

- Cumulative quality of life rating;
- NSA Trend from 2002-2008
- Statistical background data on the NSA;
- NSA location map;
- Individual neighborhood data for each of the 20 variables used in the analysis with comparable citywide data for the same variables. In cases were citywide data could not be calculated or were inappropriate, values were not provided;

The detailed statistical data that are used to compile this profile are described in Appendix B of this report. A complete reporting of all of these data by all NSAs is contained in the technical document that accompanies this report.

Appendix B
Neighborhood Profiles: User Guide

Statistical Background Data

Population - Total population of the NSA.

Source: Mecklenburg County Property Records and Land Management, 2007; Claritas, 2007; United States Census Bureau, 2000.

Youth Population – Total youth population of the NSA.

Source: Mecklenburg County Property Records and Land Management, 2007; Claritas, 2007; United States Census Bureau, 2000.

Number of Housing Units - Number of residential housing units in each NSA.

Source: Mecklenburg County Property Records and Land Management, 2007.

Area (Acres) - Area of the NSA in acres.

Source: Charlotte-Mecklenburg Planning Commission, 2007.

Median Household Income - Median household income using Census Block Group statistics.

Source: Claritas, 2007.

Average House Value - 2007 sales value for single-family homes, condominiums, and townhouses average in each NSA.

Source: Mecklenburg County Property Records and Land Management, 2007.

Neighborhood Organizations – The total number of neighborhood organizations for each NSA was identified.

Source: Neighborhood Development, 2007.

Unemployment Index – For each zip code in Charlotte, the number of people applying for unemployment benefits were totaled for the months of July 2007 through December 2007. This total was divided by the number of persons able to work. The resulting number was indexed based on the following:

$$
\begin{array}{ll}
0 - 3.0\% & \text{Low} \\
3\% - 6.5\% & \text{Medium} \\
6.5\% - 9.25\% & \text{High}
\end{array}
$$

The resulting index was assigned to each NSA that fell in the respective zip code's boundary.

Source: Employment Security Commission of North Carolina, 2007.

Social Dimension

Percent of Persons over Age 64 - Percentage of the population that is 65 years and older.

Source: Claritas, 2007.

Average Kindergarten Score – Average achievement score was calculated for each kindergarten student at the end of the year. These scores include math and verbal scores.

Source: Charlotte-Mecklenburg Schools System, 2007.

Dropout Rate – Percentage of high school students who dropped out of school.

The total number of high school students and the total number of high school students who dropped out were compiled for each NSA. The total number of high school students who dropped out was then divided by the total number of high school students.

Source: Charlotte-Mecklenburg School System, 2007.

Percent of Children Achieving at or above Grade Level – Percentage of seventh and eighth grade students who achieved scores at or above grade level for end of grade test.

Source: Charlotte-Mecklenburg School System, 2007.

Percent of Births to Adolescents - Percent of children born in 2006 to women 18 years and younger.

Sources: Mecklenburg County Health Department, Birth Certificate Data, 2006.

Youth Opportunity Index - Measure of the potential opportunities for youth to get involved in extra-curricular activities within each NSA.

"Opportunities" were defined as sites within the NSA that offered programs and activities for youth up to age 18. These sites included YMCA/YWCAs, churches, schools offering before and/or after school programs, recreation centers, community centers and libraries. These locations were scored as follows:

- Churches–Because churches provide services beyond their NSA boundaries, each church was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the church. Each church was given a score of 1, which was a minimal score for potential activity center. Each residential unit captured by the buffer zone was assigned a score of 1.
- Schools–Schools were given a score of 1 for a before-school program and a score of 1 for an after-school program. The highest score possible for a single school was 2 for having both programs. Because these schools provided services beyond their NSA boundaries, each school was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the school. Each residential unit captured by the buffer zone was assigned a score of based on the programs provided by the adjacent school
- Recreation Centers, Community Centers and YWCA/YMCAs–Because these centers provide services beyond their NSA boundaries, each center was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the center. Each center was given a score of 3. This value was assigned to every residential unit within the buffer zone.
- Libraries–Libraries were scored using the same methodology as the centers. However, a library was given a score of 2, indicating that it potentially offered greater services than a church but fewer than a Recreation Centers, Community Centers or YWCA/YMCAs. Each residential unit that fell in the buffer zone was assigned a score of 2.

Each residential unit within a NSA had the potential of receiving a score ranging from 0 to 8. The score for each NSA was calculated based the average youth opportunity score for each residential unit. This composite score represents the total number and types of opportunities available to youth.

0.0 - 0.09	*Low Youth Opportunity*
0.09 - 0.90	*Medium Youth Opportunity*
1.00+	*High Youth Opportunity*

Source: Charlotte Area YMCAs, 2007.
Charlotte Area YWCAs, 2007.
Charlotte-Mecklenburg Library System, 2007.
Charlotte-Mecklenburg Park and Recreation Department, 2007.
Charlotte-Mecklenburg Schools, 2007.

Crime Dimension

Violent Crime Rate - Violent crime rate in each NSA as compared with the violent crime rate in the City of Charlotte.

The locations of violent crime offenses between July 2006 and June 2007 were summarized for each NSA and the City of Charlotte. For the purpose of this study, violent crimes include homicides, rapes, robberies, and aggravated assaults defined according to UCR (Uniform Crime Report) standards.

The number of violent crime incidents for each NSA and the City of Charlotte were divided by their respective populations to get the violent crime rate for each NSA and the City of Charlotte.

The Location Quotient method was used to compare the NSA and city wide rate. The method gives a measure of the share of all violent crime in the City of Charlotte captured by the individual NSA. Thus, a score of 2.00 indicates that the particular NSA has a violent crime rate that is twice the rate in the city; while a score of 0.5 shows that the NSA violent crime rate is one-half the rate of the entire city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2007.

Juvenile Arrest Rate - Juvenile arrest rate in each NSA as compared with the juvenile arrest rate in the City of Charlotte.

The locations of juvenile arrests between July 2006 and June 2007 were summarized for each NSA and the City of Charlotte. For the purpose of this study, juvenile arrests are based on individuals arrested under the age of 16. This definition is based on North Carolina state statutes which generally define a juvenile offender according to this age definition.

The number of juvenile arrest incidents for each NSA and the City of Charlotte were divided by their respective juvenile populations to get the juvenile arrest rate.

The Location Quotient method was used to compare the NSA and city wide rate. The method gives a measure of the share of all juvenile arrests in the City of Charlotte captured by the individual NSA. Thus, a score of 2.00 indicates that the particular NSA has a juvenile arrest rate that is twice the rate in the city; while a score of 0.5 shows that the NSA juvenile arrest rate is one-half the rate of the entire city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2007.

Property Crime Rate - Property crime rate in each NSA as compared with the property crime rate in the City of Charlotte.

The locations of property crime offenses between July 2006 and June 2007 were summarized for each NSA and the City of Charlotte. For the purpose of this study, property crimes include burglaries, larcenies, vehicle thefts, arsons, and vandalisms defined according to UCR (Uniform Crime Report) standards.

The number of property crime incidents for each NSA and the City of Charlotte were divided by their respective populations to get the property crime rate.

The Location Quotient method was used to compare the NSA and city wide rate. The method gives a measure of the share of all property crime in the City of Charlotte captured by the individual NSA. Thus, a score of 2.00 indicates that the particular NSA has a property crime rate that is twice the rate in the city; while a score of 0.5 shows that the NSA property crime rate is one-half the rate of the entire city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2007.

Crime Hot Spots – Proportion of a NSA that has a durable concentration of violent crime.

For the purpose of this study, the crimes compiled in the hotspot analysis were violent crimes including homicides, rapes, robberies, and aggravated assaults defined according to Part I and Part II offense categories as defined by Uniform Crime Reporting standards with the inclusion of missing persons and hit-and-runs. A density grid was created from the violent crime point data using a 250' cell size, a 1500' search radius, and the kernel method. Cells with a density greater than 3 standard deviations above the mean of the grid were considered hot cells. Locations with 5 or more overlapping, monthly hotspots were considered durable hotspots and flagged to be included to calculate final hotspot values for each NSA.

The total number of durable hot cells was divided by the total number of cells for each NSA to get the proportion of a NSA that is considered a durable violent crime hotspot. For instance, a value of 0.9 indicates that 90% of the particular NSA is covered by a durable violent crime hotspot; while a value of 0 indicates that no part of a NSA is a durable violent crime hotspot.

Source: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2007.

Physical Dimension

Appearance Index – Index of code violations for each NSA.

The violations recorded from July 2006 to June 2007 were summarized for each NSA. The number of documented violations was divided by the total number of parcels in the NSA.

Source: Neighborhood Development, 2007.

Housing Code Index - Percentage of housing units in a NSA with housing code violations.

The violations recorded from July 2006 to June 2007 were summarized for each NSA. The number of documented violations was divided by the total number of housing units in the NSA.

Source: Neighborhood Development, 2007.

Home Ownership - Percentage of owner-occupied residential units.

Source: Mecklenburg County Property Records and Land Management, 2007.

Projected Infrastructure Improvement Costs – Estimated public construction costs for sidewalk, curb, and minor drainage, not including any funds for the repair or installation of major drainage systems.

The total area of the NSA is calculated in square miles. The estimated construction costs were divided by the total area to get the infrastructure cost per square mile for each NSA.

Source: Charlotte Engineering and Building Maintenance Department Assessments, 2007.

Percent of Persons with Access to Public Transportation – Percentage of NSA residents, who live within walking distance of public transportation, using the Charlotte Area Transit System bus stops.

By utilizing the tax parcel database, the total number housing units and the total number of housing units within ¼ mile of a bus-stop were compiled for each NSA. The transit accessible housing units were divided by the total number of housing units.

Source: Charlotte Area Transit System, 2007.

Percent of Persons with Access to Basic Retail Facilities – Percentage of NSA residents that are within walking distance to a grocery store and/or a pharmacy.

By utilizing the tax parcel database, the total number housing units and the total number of housing units within one-quarter mile of a grocery store and/or pharmacy were compiled for each NSA. The retail accessible housing units were divided by the total number of housing units.

Sources: Mecklenburg County Property Records and Land Management, 2007.
        BellSouth Yellow Pages, Charlotte, 2007.

Pedestrian Friendliness Index – Pedestrian friendliness based on the total length of sidewalks in each NSA as compared to the total length of the streets. Index values could rank from 0-2.0. The index score were scaled using the following qualitative ranking.

> 0.0 - 1.0 Low Pedestrian Friendliness
> 1.1 - 1.3 Medium Pedestrian Friendliness
> 1.4+   High Pedestrian Friendliness

Source: Charlotte Department of Transportation, 2007.

Economic Dimension

Percent of Persons Receiving Food Stamps - The percentage of people in a NSA receiving Food Stamps.

Sources: Mecklenburg County Department of Social Service Office of Planning and Evaluation, 2007.

Percent Change in Income – Percentage change in median household income from 1999 to 2007 per year. The following equation was used:

$$\frac{2007\ income - 1999\ income}{1999\ income} * 100 = \%\ Change\ in\ Income$$

Source: Claritas, 2007; Census 2000.

Percent Change in House Value – Percent change in residential house value per year was calculated using the following equation:

$$\frac{2007\ sales\ value - 2003\ assessed\ value}{2003\ assessed\ value} * 100 = \%\ Change\ in\ House\ Value$$

Source: Mecklenburg County Property Records and Land Management, 2007.

Appendix C
NSA Trend 2002-2008 by Variable

NSA Trend by Variable

The following section presents trend information for the 14 variables used to calculate the NSA trend from 2002 to 2008. Every NSA is represented in a numeric-ordered row, 1 through 1999. Each variable is represented in a column. Every variable has been color coded to represent its classification. A variable was coded green to show improving or "Trending Up" changes. A variable show no significant change was coded yellow. Finally, variables showing a decline or "Trending Down" change were coded red. A summary of the six year trends for each NSA is presented at the end of each row. It follows the same color coding scheme.

Variable Trend Change 2002 to 2008

The numbers reflected in this table are considered estimates and derived from various sources. They should be used for descriptive purposes only and are not reliable for statistical analysis.

# Appendix E
CWAC Analysis

CWAC Neighborhoods

The two earliest neighborhood quality of life studies were focused exclusively on the 73 neighborhoods comprising the City Within a City (CWAC). As a consequence the quality of life indices developed for 1993 and 1997 did not contain the newer and most suburban communities in Charlotte.

Beginning in 2000, the CWAC geography was replaced by the larger, more comprehensive neighborhood statistical area (NSA) framework. Within this framework, all analyses of neighborhood quality of life were structured to reflect citywide measurement rather than inner city or suburban boundaries.

With this background, the merger of the older 73 CWAC neighborhoods with newer 100 NSA communities is the most relevant neighborhood framework for planning and program evaluation purposes. However, to the extent that CWAC remains a concern for Charlotte's neighborhood development policy-makers and staff, it is useful to continue to track the state of neighborhood quality of life in the CWAC areas. Accordingly, a separate statistical analysis, including only the CWAC NSAs in the analysis, was performed. These findings are presented in the following map.

Within this specialized analytical framework, the number of stable communities within CWAC has grown significantly, from 24 in 1997 to 34 in 2008. Conversely, there has been a decline in challenged neighborhoods from 15 to 6. Although the number and composition of the quality of variables has changed between the 1997 and 2008, making direct comparison impossible, the strategic shift to stable neighborhoods supports the conclusion that CWAC neighborhoods are making substantial strides in community quality of life. Figure 1 shows the CWAC only analysis results for 2008.
